Research Officer (with an honours degree in engineering or science or equivalent qualifications) in the Division of Building Research, Commonwealth Scientific and Industrial Research Organization, Highett, Victoria, Australia, to participate in a programme of theoretical and experimental research on the properties and uses of lightweight concrete and gypsum plaster as structural materials—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2, quoting 390/209 (March 26)

Assistant Lecturer (preferably with interests in applied mathematics) in the Department of Mathematics—The Secretary, University College London, Gower Street, London, W C 1 (March 28)

Lecturer in Refractory Materials in the Department of Metallurgy—The Registrar, The University, Sheffield (March 31)

Senior Lecturer in Electrical Engineering at the University, Adelaide, South Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Adelaide, March 31)

Scientific Officer (with a first- or second-class honours degree in an approved scientific subject or other approved equivalent qualification) in the Department of Industrial and Forensic Science of the Ministry of Commerce—The Secretary, Civil Service Commission, Stormont, Belfast (April 1)

University Demonstrator (with an honours degree in some branch of natural science, and preferably with a veterinary qualification and experience in teaching the subject) in Veterinary Anatomy—Dr A S Watt, Botany Department, Downing Street, Cambridge (April 1)

Chair of Applied Mathematics—The Registrar, The University, Sheffield 10 (April 2)

Research Fellows, for independent research—The Registrar, The University, Reading (April 12)

READER or SENIOR LECTURER IN APPLIED MATHEMATICS at the University of Hong Kong—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Hong Kong, April 15)

I C I RESEARCH FELLOWS IN BIOCHEMISTRY, CHEMISTRY, CHEMOTHERAPY, ENGINEERING, METALLURGY, PHARMACOLOGY, PHYSICS or allied subjects—The Academic Registrar, University of London, Senate House, London, W C 1 (April 16)

TURNER AND NEWALL RESEARCH FELLOWS IN ENGINEERING, INORGANIC CHEMISTRY, PHYSICS or an allied subject—The Academic Registrar, University of London, Senate House, London, W C 1 (April 16)

ASSISTANT LECTURER (honours graduate in botany or agricultural botany) IN AGRICULTURAL BOTANY—The Registrar, The University, Reading (April 30)

RESEARCH ASSISTANT (with a medical degree or an honours degree in physiology or zoology) IN THE CLIMATIC AND WORKING EFFICIENCY UNIT of the Medical Research Council, Department of Human Anatomy, University of Oxford, to take part in fundamental studies of muscle and joint action and the application of this to clinical, industrial and service problems—Prof Sir Wilfrid Le Gros Clark, F R S , Department of Human Anatomy, University Museum, Oxford (April 30)

RESEARCH FELLOW IN THE DEPARTMENT OF CHEMISTRY for work on heterogeneous catalysis—Prof C Kemball, Queen's University, Belfast (April 30)

ASSISTANT PROFESSOR OF SOIL SCIENCE—Head of the Department of Soil Science, Faculty of Agriculture, University of Alberta, Edmonton, Alberta, Canada (May 1)

ASSISTANT LECTURER, Grade B (with a good honours degree in physics or electrical engineering, and with some research, industrial or teaching experience) IN THE DEPARTMENT OF APPLIED PHYSICS, College of Technology and Commerce, Cardiff—The Director of Education, City Hall, Cardiff

CHEMIST or BIOLOGIST (with at least a second-class honours degree in chemistry or biology, and a good knowledge of chemical analysis) IN THE HEALTH PHYSICS DIVISION, to undertake work on the uptake and metabolism of radioactive elements in biological materials—The Establishments Officer, United Kingdom Atomic Energy Authority, Atomic Energy Research Establishment, Harwell, Didcot, Berks, quoting 2/103/237

FISHERIES OFFICER (with a university degree in natural science, preferably zoology) in the Lake Victoria Fisheries Service, East Africa High Commission, for duties which include the development and control of the fisheries of Lake Victoria—Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1 quoting BCD 65/88/01

LECTURER Grade B (graduate of a British university with chemistry as one of the major subjects, and preferably with a knowledge of nutrition or hygiene), to teach Science as applied to Catering and allied subjects—Clerk to the Governing Body, Battersea Polytechnic, London, S W 11

RESEARCH ENGINEER (about 27 years, with an honours degree in engineering and one or two years practical experience) IN THE RESEARCH AND DEVELOPMENT DIVISION of the Cement and Concrete Association, near Slough, to work on concrete materials and methods of construction—The Secretary, Cement and Concrete Association, 52 Grosvenor Gardens, London, S W 1

SENIOR SOIL CONSERVATION OFFICER (with a university degree in an appropriate subject, and at least one years postgraduate study or experience of soil conservation) IN THE DEPARTMENT OF AGRICULTURE, Gold Coast Local Civil Service, for duties which comprise the planning, administration and execution of schemes for soil conservation and land utilization, and the tendering of advice on problems of soil conservation—The Director of Recruitment, Colonial Office, 2 Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 63/13/017

SOIL SURVEY OFFICER (with a degree either in geography, or in science with geology or geography as one subject) IN THE DEPARTMENT OF AGRICULTURE, Western Region, Nigeria, to take part in the field work of a scheme of systematic classification and mapping of soils—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 63/410/02

PERMUTIT ION EXCHANGE MATERIALS

The use of Permutit Ion Exchange Materials in many roles distinct from water treatment, has resulted in the development of numerous new industrial processes giving improved results and lower running costs Some materials now available are —

Zeo-Karb Na. A sulphonated coal product containing both strong and weak acid groups

Zeo-Karb 215. A nuclear sulphonated phenol resin containing also hydroxyl groups

Zeo-Karb 225 A unifunctional cross linked sulphonated polystyrene resin in bead form of high capacity and exceptional chemical and physical stability

Zeo-Karb 226. A unifunctional cross linked methacrylic acid resin in bead form containing only carboxyl groups as the ion active groups

De-Acidite E. A high capacity anion exchange material of medium basicity.

De-Acidite FF. A unifunctional very highly basic anion exchange resin in bead form based on cross linked polystyrene and containing quaternary ammonium groups

De-Acidite G A unifunctional weakly basic anion exchange resin in bead form based on cross linked polystyrene and containing diethylamino groups

De-Acidite H. A material similar to "De-Acidite G" but containing dimethylamino groups.

Bio-Deminrolit. A mixed cation and anion exchange resin for demineralisation in a single column

Decalso F A synthetic sodium aluminium silicate suitable for the separation and concentration of vitamins and hormones

Decolorite. A resin of high porosity for removing colour from solutions

Permaplex C-10. A highly selective cation exchange resin membrane containing SO_3H groups.

Permaplex A-10. A highly selective anion exchange resin membrane containing quaternary ammonium groups

For full technical information please write to · THE PERMUTIT COMPANY LIMITED Head Office and Laboratories Dept V H 92, Permutit House, Gunnersbury Avenue, London, W 4 Telephone CHIswick 6431

LECTURES AND COURSES

BIRKBECK COLLEGE
(UNIVERSITY OF LONDON)
SESSION 1955-1956 BEGINS MONDAY, OCTOBER 3, 1955

Part-time (Evening) Courses provided for Internal Degrees in the Faculties of Arts and Science and for the Academic Postgraduate Diploma in Psychology Facilities also provided for part-time and full-time students reading for higher degrees in arts and science Applications for admission should be made before June 1

Pamphlet and form of application may be obtained from the Registrar, Birkbeck College, Malet Street, W C 1

UNIVERSITY OF LONDON

A lecture entitled "Fact and Fiction in Elementary Dynamics" will be given by Professor T M Cherry (Melbourne) at 5 30 p m on March 14 at University College (Anatomy Theatre), Gower Street, W C 1

Admission free without ticket

JAMES HENDERSON,
Academic Registrar

UNIVERSITY OF LONDON

A course of three lectures on "Paramecium in Modern Biology" will be given by Professor T M Sonneborn (Indiana) at 5 30 p m on March 9, 10 and 11 at University College (Anatomy Theatre), Gower Street, W C 1

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

UNIVERSITY OF LONDON

A course of three lectures on "The Cultural Landscape of Germany, Rural and Urban" will be given by Dr G Pfeifer (Heidelberg) at 5 30 p m. on March 10, 14 and 15 at Queen Mary College, Mile End Road, E 1

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

UNIVERSITY OF LONDON

A course of two lectures on "Curare-Alkaloids" will be given by Professor P Karrer (Zurich) at 5 30 p m on March 10 and 11 at University of London Senate House, W C 1

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

THE MEMBERS OF THE BRITISH PSYCHO-analytical Society invite you to attend the annual Ernest Jones Lecture entitled "The Logic of the Unconscious," which will be given on Monday March 14, at 8 30 p m, in the Barnes Hall of the Royal Society of Medicine (by kind permission of that Society) by John Wisdom, Fellow of Trinity College, Cambridge

---

NOTTINGHAM AND DISTRICT TECHNICAL COLLEGE
SHAKESPEARE STREET, NOTTINGHAM
Principal H Baker Ph D, A M I C E, A M I Mech E
FULL-TIME COURSES—SESSION 1955-56

B Sc Special Chemistry (External), University of London and A R I C Vacancies exist in these courses which commence on September 19 1955 Applications for admission should be made on forms obtainable from the Registrar of the College as soon as possible Students who have commenced the course by part-time study may be admitted direct to the second or final year Hostel accommodation is available for male students Suitably qualified students for the above courses may be eligible for financial assistance from their Local Education Authority Ph D (External), M Sc (External), University of London A limited number of vacancies exist for graduates wishing to undertake research work in organic chemistry (heterocyclic chemistry) or physical chemistry (surface chemistry) in preparation for the above degrees Special awards exist for those resident in the East Midland area

Initial inquiries should be made to Mr J R Rowlands, M Sc, A R I C, Head of the Department of Science

F STEPHENSON,
Clerk to the Joint Education Committee

OFFICIAL APPOINTMENTS

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged 18 to 64 inclusive, or a woman aged 18 to 59 inclusive, unless he or she, or the employment is excepted from the provisions of the Notification of Vacancies Order 1952

WEST LONDON HOSPITAL
HAMMERSMITH ROAD LONDON, W 6
QUALIFIED BIOCHEMIST

Required with considerable experience of clinical biochemical analysis and research Salary scale (principal grade) £1,125 by £50 to £1,375, plus £50 London weighting

Age qualifications, experience, names of two referees to Secretary, Board of Governors The Hammersmith, West London and St Mark's Hospitals, 150 Du Cane Road, London, W 12, by March 14

COMMONWEALTH of AUSTRALIA
APPOINTMENT NO 480/152 OF SENIOR TECHNICAL OFFICER OR PRINCIPAL TECHNICAL OFFICER
COAL RESEARCH SECTION

The Commonwealth Scientific and Industrial Research Organization invites applications for appointment to a position of Senior Technical Officer or Principal Technical Officer at the Coal Research Section, North Ryde, New South Wales Duties Supervision of the collection, preparation, testing and chemical analyses of coal samples in connection with the Section's survey of the physical and chemical properties of Australian coals Qualifications University degree in science or equivalent qualifications, with experience in collection of samples and the complete analysis of coal Salary Dependent of qualifications and experience, commencing salary will be determined within the range of Principal Technical Officer, £A 1,646 to £A 1,814 per annum actual, four increments, subject to efficiency bar at £A 1,730 per annum actual, or Senior Technical Officer, £A 1,310 to £A 1,562 per annum actual, six increments subject to efficiency bar at £A 1,436 per annum actual Fare to Australia (including those of wife and family) will be paid The appointment is subject to a satisfactory medical examination and the appointee may be granted superannuation privileges

Applications, referring to Appointment No 480/152, and stating full name place, date and year of birth, marital state nationality, present employment, particulars of qualifications and experience, and of war service, if any, accompanied by the names and addresses of two persons willing to act as referees, if required and copies of not more than four testimonials, should reach the undersigned not later than April 9, 1955

W IVES,
Chief Scientific Liaison Officer
Australian Scientific Liaison Office,
Africa House, Kingsway London, W C 2

H M OVERSEA CIVIL SERVICE

Applications are invited for the following post Assistant Conservator of Forests, Cyprus Candidates must possess a university degree in forestry and should preferably be under 40 years of age Appointment on contract for two years in the salary scale £734 to £1,094 a year, plus an overseas allowance of 15 per cent of salary Point of entry into the salary scale depends on qualifications and experience A gratuity of £25 or £37 10s (according to salary) is payable for each completed three months of satisfactory service Outfit allowance of £30 Free passages for officer, wife and up to three children on appointment and satisfactory completion of contract Government quarters when available at moderate rental Taxation of salary at local rates

Apply, giving brief particulars to the Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street London, S W 1, quoting reference BCD 61/17/01

AGRICULTURAL RESEARCH COUNCIL require an Assistant Experimental Officer in their Unit of Plant Nutrition, Long Ashton, to assist in investigations on the effects of micro-nutrient elements on the growth of higher plants Qualifications general certificate of education (advanced) or pass degree in botany, or equivalent qualification Some knowledge of chemistry an advantage Salary according to age within scale £288 (at age 18), rising to £640 (men) and to £540 (women) Contributory superannuation scheme —Applications, with names of two referees, to be sent to the Secretary, Research Station, Long Ashton, Bristol, within two weeks

H PICKBOURNE
Registrar

MINISTRY OF SUPPLY REQUIRE SCIENtific Officers for research and development on targets for guided weapons at Royal Aircraft Establishment, Farnborough, Hants Post 1 primarily concerned with performance assessment experience in aerodynamics useful Post 2 concerned with automatic control problems, knowledge of servomechanism theory an advantage Qualifications first- or second-class honours degree or equivalent in mathematics or mathematical physics Salary within range £467 10s to £845 Women somewhat less Prospects of promotion to higher grades Not established but opportunities to compete for establishment may arise F S S U benefits may be available —Application forms from Ministry of Labour and National Service Technical and Scientific Register (K) 26 King Street London S W 1 quoting A 36/5A Closing date March 19 1955

VICTORIAN GOVERNMENT RAILWAYS offer careers in Australia to (a) Engineer (communications) starting as Engineer Class 2 with salary range from £A 1 373 to £A 1 443 subject to quarterly adjustments in accordance with cost of living Higher salaries on promotion Candidates must hold a university degree or technical college diploma or equivalent in electrical engineering or communications engineering (b) Assistant Engineer (signalling) starting as Assistant Engineer Class 3 with salary ranging from £A 958 (minimum Class 3) to £A 1 138 (maximum Class 2) subject to quarterly adjustments in accordance with cost of living Commencing salary according to qualifications and experience Higher salaries on promotion Candidates must hold technical college diploma or equivalent in electrical engineering Special housing and travelling facilities Generous leave and superannuation benefits —Apply in writing to Agent-General for Victoria Victoria House Melbourne Place Strand London W C 2 giving briefly age marital status, qualifications and experience Please endorse envelope "Victorian Railways"

COMMONWEALTH of AUSTRALIA

APPOINTMENT NO 290/395 OF RESEARCH OFFICER—CHEMIST

DIVISION OF FOREST PRODUCTS

The Commonwealth Scientific and Industrial Research Organization invites applications for appointment to a position of Research Officer, Division of Forest Products, S Melbourne Duties To carry out fundamental and applied research in various chemical aspects of wood preservation against fungi, termites borers and marine organisms, etc Qualifications University honours degree or higher qualifications with chemistry as a major subject Salary Dependent on qualifications and experience, commencing salary will be determined within the range of Research Officer, £A 1 184 to £A 1 730 per annum actual, thirteen increments subject to efficiency review at £A 1 268 and £A 1 520 per annum actual Fare to Australia (including those of wife and family) will be paid The appointment is subject to a satisfactory medical examination and the appointee may be granted superannuation privileges

Applications referring to Appointment No 290/395 and stating full name place date and year of birth marital state nationality present employment particulars of qualifications and experience and of war service if any accompanied by the names and addresses of at least two persons willing to act as referees, if required and copies of not more than four testimonials, should reach the undersigned not later than April 2 1955

W IVES,
Chief Scientific Liaison Officer

Australian Scientific Liaison Office,
Africa House,
Kingsway London W C 2

McMASTER UNIVERSITY

DEPARTMENT OF PHYSICS

GRADUATE ASSISTANTSHIPS

Applications are invited for part time teaching and research assistantships in the Department of Physics McMaster University from persons qualified to register in courses leading to the M Sc and Ph D degrees Assistantships normally carry a yearly stipend of $1 450 to $1 850 Assistants are required to devote 10 to 12 hours per week to duties during the academic session (October to April inclusive) and are able to devote full-time to their research during the summer Research is in progress in the following fields Theory of Molecular Spectra F R Britton, Atomic Mass Determinations H E Duckworth Cosmic Rays F Gulbis Beta and Gamma Spectroscopy M W Johns Microwave Diffraction A B McLay, Solid State, H E Petch, Theoretical Nuclear Physics M A Preston Fission Yields and Isotopic Abundances H G Thode

Interested persons should write to Dr H E Duckworth Department of Physics Hamilton College McMaster University Hamilton Ontario, Canada

UNIVERSITY OF SHEFFIELD

Applications are invited for the newly established Chair of Applied Mathematics to be filled as soon as possible The term Applied Mathematics" is to be interpreted in a wide sense—e g a candidate whose field is theoretical physics or astrophysics or meteorology would be acceptable Salary £2 150 with F S S U provision and family allowance

Further particulars should be obtained from the Registrar The University Sheffield 10 to whom applications should be sent by April 2 1955

UNIVERSITY OF LONDON

Applications are invited for I C I Research Fellowships in Biochemistry Chemistry Chemotherapy Engineering Metallurgy Pharmacology Physics or allied subjects tenable from October 1, 1955 normally for three years in the first instance Salary not less than £750 per annum, with family allowances and F S S U

Information and application forms can be obtained from the Academic Registrar University of London Senate House W C 1 Applications must be received not later than April 16 1955

ST BARTHOLOMEW'S HOSPITAL

LONDON E C 1

Applications are invited for the post of Chemical Pathologist to the Hospital and Lecturer in Chemical Pathology to the Medical College tenable as from July 1 1955 The successful candidate will be on a full-time salary basis part of which will be paid by the hospital and part by the medical college The appointment will be subject to a satisfactory health report

Applications together with the names of three referees should be received not later than April 1 1955 and should be addressed to C C Carus Wilson Clerk to the Governors

GAS COUNCIL

SCIENTIFIC SECRETARY

Applications are invited for the appointment of Scientific Secretary to the Gas Council at a salary of the order of £2 500 per annum The successful applicant will be expected generally to advise on scientific matters and particularly to act on behalf of the Research Committee of the Gas Council in maintaining liaison between that committee, the Directors in charge of the Council's Research Stations, the various research associations and other organizations conducting research with which the Gas Council may be associated The successful candidate must have had considerable experience in the direction of research and should be able to show a proper appreciation of the relationship between research and commercial development - While the directors in charge of research stations will maintain their full responsibilities to the Gas Council for the conduct of their stations, the Scientific Secretary must be fully qualified to discuss with them the various lines of investigation in hand or projected The appointment will be pensionable, unless the successful applicant is over 55 years of age on appointment

Applications, giving full particulars of academic qualifications and appointments held, should be sent to reach the Secretary, The Gas Council 1 Grosvenor Place, London, S W 1, not later than April 16, 1955

UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Assistant Lecturer or Lecturer in the Department of Zoology The initial salary for an Assistant Lecturer will be £550 per annum The initial salary for a Lecturer will be within the range £650 to £800 per annum, according to qualifications and experience

Applications, stating age, experience and academic qualifications together with the names of three referees, should be received not later than April 2, 1955 by the undersigned, from whom further particulars of the conditions of appointment may be obtained

STANLEY DUMBELL,
Registrar

UNIVERSITY COLLEGE OF THE WEST INDIES

Applications are invited for the Chair of Zoology Salary £1,800 per annum Child allowance £80 per annum per child (maximum £240 per annum) F S S U Passages paid on appointment, termination and study leave Unfurnished accommodation at rental of 5 per cent of basic salary Duties to be assumed by October 1, 1955

Applications (eight copies) detailing qualifications and experience and naming three referees, to be received by March 21, 1955, by Secretary Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W C 1, from whom further particulars may be obtained

---

UNIVERSITY OF LEEDS

Applications are invited for Imperial Chemical Industries Limited Research Fellowships in Bacteriology, Biochemistry Biomolecular Structure, Botany (Plant Biochemistry and Biophysics), Chemical Engineering, Chemistry, Chemistry of Leather Manufacture Chemotherapy Colour Chemistry and Dyeing Engineering (Civil, Electrical or Mechanical) Fuel and Refractories Geology (including Geochemistry), Metallurgy, Mining (Selective Flotation and Geophysical Surveying), Pharmacology Physics, Physiology or Textile Industries (Protein Chemistry and Wool Textile Engineering) The Fellowships will be of an annual value within the range £600 to £900 a year according to qualifications and experience and will normally be tenable for three years

Further particulars can be obtained on request Three copies of applications (one in the case of applicants from overseas), together with the names of two referees should reach the Registrar, The University, Leeds, 2, not later than April 15, 1955

UNIVERSITY OF MANCHESTER

Applications are invited for the posts of Lecturer in Astronomy and two Lecturers in Radio-Astronomy Salary on a scale £500 to £1,100 per annum, initial salary according to qualifications and experience (Salary scales are at present under review) Membership of F S S U and children s allowance scheme

Applications should be sent not later than March 26, 1955, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained

---

H M OVERSEA CIVIL SERVICE

Vacancies exist for Chemists in the Department of Chemistry, Federation of Malaya Qualifications Honours degree in chemistry with Associateship or Fellowship of Royal Institute of Chemistry Two years' specialized experience in some line (forensic science, toxicology, foods, drugs and water, bacteriology, pharmacy, etc), relevant to the work in Malaya, or research experience indicated by Ph D or comparable post-graduate qualification For pensionable employment age limit 25-30 For contract appointments age limit may be exceeded Duties General analytical and consultative work on liquors, foods, drugs, water and petroleum etc Clinical analysis and examination of exhibits for court evidence Inspection of petroleum carrying vessels and explosives To make reports, give evidence in court, and assist in the training of subordinate staff Terms of appointment (a) Pensionable with salary and pensionable overseas allowance from £1,004 to £2,072 per annum (incremental credits may be granted for experience) An additional non-pensionable overseas allowance for a married officer A substantial non-pensionable cost-of-living allowance, according to family commitment is also payable to all officers At present total emoluments for a single man range from £1,218 per annum to £2,100, for a married man without children from £1,442 per annum to £2,499 per annum, and for a married man with dependent children from £1,533 per annum to £2,730 per annum (b) On contract for three years (with provision for renewal) in above salary scale and with same allowances Gratuity is payable at rate of £70 for each completed period of three months' satisfactory service on full pay provided officer's basic salary is £1,277 per annum, or above For basic salaries below £1,277 per annum gratuity is payable at the rate of £50

Apply, in writing, to the Director of Recruitment, Colonial Office, Great Smith Street, London, S W 1, giving briefly age, qualifications and experience Mention the reference number (BCD /97/60/01)

EAST AFRICA HIGH COMMISSION

FISHERIES OFFICER

Vacancy for a Fisheries Officer, Lake Victoria Fisheries Service, East Africa High Commission Duties include the development and control of the fisheries of Lake Victoria Qualifications Candidates must possess a university degree in natural science, preferably zoology, and be under 35 years of age Terms of Appointment Pensionable after a probationary period of two years Emoluments Salary scale £816 to £1,620 a year Point of entry into the salary scale depends on qualifications and experience Variable non-pensionable cost of living allowance, at present at the rate of 10 per cent of salary Outfit allowance £30 if initial salary below £1,032 a year Government quarters when available at rental of not more than £102 a year Free passages for officer, wife and up to one full fare for children on first appointment and leave Taxation at local rates

Apply, giving brief particulars to the Director of Recruitment, Colonial Office, Sanctuary Buildings Great Smith Street, London, S W 1, quoting reference BCD 65/88/01

UNIVERSITY OF LEEDS

DEPARTMENT OF MINING

The Council invites applications for two Research Assistantships in the Department of Mining at salaries up to £500 a year according to qualifications and experience Candidates should hold a good honours degree in physics or physical chemistry

Applications (three copies), stating date of birth qualifications and experience together with the names of three referees, should reach the Registrar The University, Leeds, 2 (from whom further particulars may be obtained) not later than March 18, 1955

ROWETT RESEARCH INSTITUTE

Assistant Experimental Officer required for biochemical work on certain rumen micro-organisms Candidates should be graduates or hold a higher national certificate in chemistry or its equivalent Some experience in bacteriology would be desirable Salary scale (men) £288 10s (aged 18) to £640 per annum, (women) £288 10s (age 18) to £540 per annum

Applications stating date of birth, with particulars of education and experience, together with the names of two referees, should be sent to the Secretary, Rowett Research Institute, Bucksburn, Aberdeenshire

---

TROPICAL RESEARCH FELLOWSHIP

(MEDICAL SCIENCES)

Applications are invited by the Council of th Royal Society for a Research Fellowship wit special reference to ill health in the tropics Th Fellowship is tenable in any university, hospit or medical school or other institution approved b the Royal Society in the British Commonwealth The successful applicant, who need not necessaril hold a medical qualification, will be expected t spend some part of the period of tenure in th tropics The appointment will be for two yea in the first instance, from October 1, 1955, an may be renewed annually up to a total of fiv years It will be subject to the conditions govern ing Royal Society Research Appointments Th stipend will be £1,250 per annum

Applications, which should be made on form to be obtained from the Assistant Secretary, Th Royal Society, Burlington House, London, W 1 should be received as early as possible, in an case not later than May 31, 1955

GOLD COAST LOCAL CIVIL SERVICE

SENIOR SOIL CONSERVATION OFFICER
DEPARTMENT OF AGRICULTURE

Duties comprise the planning, administratio and execution of schemes for soil conservatio and land utilization, and the tendering of advic on problems of soil conservation Candidat must possess a university degree in an appropriat subject and have had at least one years' pos graduate study or experience of soil conservatio Appointment on contract in the salary scal £1,530 to £1,950 a year with a gratuity of £25 t £37 10s for each completed three months of sati factory service Outfit allowance of £30 payabl on first appointment Free first-class passages o appointment and leave for officer, wife and up t three children under thirteen years of age Gene ous home leave Taxation at local rates

Apply, giving brief particulars, to the Directo of Recruitment, Colonial Office, 2 Sanctuar Buildings, Great Smith Street, London, S W 1 quoting reference BCD 63/13/017

DEPARTMENT OF AGRICULTUR

WESTERN REGION, NIGERIA
SOIL SURVEY OFFICER

To take part in the field work of a scheme o systematic classification and mapping of soil Candidates must possess a university degree eithe in geography or in science with geology or geography as one subject Some knowledge of chemistry and an interest in botany and plant geography desirable Appointment on contract i the salary scale £627 to £1,287 a year, plus a allowance of £180 to £270 a year A gratuity c £25 to £37 10s is payable for each three month of satisfactory service Outfit allowance of £6 Free first-class passages on appointment and leav for officer, wife and two children under 18 yea of age Generous home leave Taxation at loc rates Government quarters when available rental of 10 per cent of basic salary

Apply, giving brief particulars to the Directc of Recruitment, Colonial Office, Sanctuary Buil ings Great Smith Street, London, S W 1, quotin reference BCD 63/410/02

COVENTRY AND WARWICKSHIR HOSPITAL

Technician required for Physics Workshop radiotherapy, isotope, research and routine work General machine shop experience essential, knowledge of electronics desirable Salary £450 t £515 per annum

Applications to Secretary, Hospital Manageme Committee, Coventry and Warwickshire Hospita Coventry

---

REGIONAL PHYSICS DEPARTMENT, 9-1 West Graham Street, Glasgow, C 4, Deput Regional Physicist It is intended shortly to ap point an additional Physicist, for duties in th Regional Physics Department, which provides variety of technical services to hospitals and medical research institutions throughout the West c Scotland Applications are now invited fro candidates possessing a wide and thorough knowledge of classical and modern physics with recen experience of a responsible kind in a large de partment devoted to the practice of clinica physics Salary will be according to the Whitle Council scale (£1,125 by £50 to £1,375) and appli cations including the names of two referees should be sent before March 26, 1955, to the Secretary and Treasurer, Board of Management fo Glasgow Western Hospitals, 10 Park Circus Glasgow, C 3

QUEEN'S UNIVERSITY OF BELFAST

Applications are invited for a Research Fellow-ip in the Department of Chemistry for work heterogeneous catalysis In addition to carry- out independent work the Fellow appointed ll be expected to assist in directing the research others working on catalytic problems The pointment will be for one year from October 1 55, and may be extended Salary £700 plus S S U benefits, or £750 without F S S U nefits

Letters of application with particulars of aca-mic qualifications and the names and addresses two referees should reach Professor C emball by April 30, 1955

UNIVERSITY OF CAMBRIDGE

SHELL RESEARCH STUDENTSHIP IN CHEMICAL ENGINEERING

The Managers of the Shell Chemical Engineer- Studies Fund invite applications for a Shell search Studentship Applicants should in neral have already received a first research de-e or at least have shown considerable promise research The successful candidate will be re-ired to engage in research in chemical engineer- under such conditions as the Managers may termine The studentship will be of £600 a ar, plus fees for two years, with the possibility an extension for a further year The success- applicant would be expected to commence ndence in October, 1955

Application forms may be obtained from the ell Professor of Chemical Engineering Depart-nt of Chemical Engineering, Tennis Court oad, Cambridge and should be completed and turned by April 23 1955

ELECTRICAL ENGINEERS REQUIRED FOR rious Research and Development Establishments Ministry of Supply at Farnborough Hants, alvern, Worcs Sevenoaks Kent, Christchurch, ants, and London H Q Applicants should have be expecting to obtain a first- or second-class nours degree or equivalent preferably with ex-rience in light electrical or electronic engineering lds Initial appointment to Scientific Officer ade Salary according to age, experience etc, thin range £467 10s to £845 (£25 to £40 higher London) Women somewhat less Prospects promotion Not established but opportunities compete for establishment may arise F S S U nefits may be available—Application forms om Ministry of Labour and National Service, chnical and Scientific Register (K) 26 King eet London S W 1, quoting D 63/5A

UNITED KINGDOM ATOMIC ENERGY thority, A E R E, Harwell Berks, requires a emist or Biologist for its Health Physics Divi-n to undertake work on the uptake and tabolism of radioactive elements in biological terials He may be required to lead a group gaged in experimental field work Applicants ould possess at least a second-class honours de-e in either chemistry or biology A good owledge of chemical analysis will be essential e successful candidate will be appointed either a Senior Scientific Officer (£1 040 to £1,205 per num) or as a Scientific Officer (£505 to £905 r annum) according to age, experience and alifications and will be required to join the thority's contributory superannuation scheme post as a Principal Scientific Officer (£1,205 to 615 per annum), might be granted to an ex-tionally well-qualified applicant—Applications ould be sent to Establishments Officer United ngdom Atomic Energy Authority A E R.E, rwell Didcot Berks quoting 2/103/237

NATIONAL COAL BOARD INVITE APPLI-ions for a superannuable appointment as entist Grade III in their Coal Survey Labora-y at Cardiff The work includes the prepara-n of detailed reports on the structure and ysical and chemical properties of coal seams of South Wales Bristol and Somerset, and Forest Dean coalfields A good honours degree (or uivalent qualification) in a science subject ferably with a sound background in geology d chemistry is required Appointment will ially be as Scientist Grade III (scale £500 by 5 to £950 male and £475 by £20 to £835 male) Promotion to Scientist Grade II (scale 00 by £35 to £1,150 male, and £700 by £30 to 000 female), is open after a period dependent experience and ability—Write giving full par-ulars (in chronological order) of age, education alifications and experience (with dates), to tional Coal Board, Establishments (Personnel), bart House Grosvenor Place London, S W 1, rking envelope TT/932 Original testimonials ould not be forwarded Closing date March 1955

COUNTY BOROUGH OF GRIMSBY EDUCATION COMMITTEE

COLLEGE OF FURTHER EDUCATION

Principal E S Green, B Sc A R I C

Applications are invited from suitably qualified persons for the following post Assistant to teach Chemistry up to final degree standard A new college is in course of erection and it is expected that there will be considerable expansion of the Science Department Applicants should possess an hons degree in chemistry, or equivalent qualification teaching and/or industrial experience are desirable Salary in accordance with the Burnham Technical Report for a Grade B Assistant (£525 by £25 to £820) plus where appropriate the usual additions for degree and training

Application forms may be obtained from the undersigned (S A E) to whom completed applications should be returned not later than 14 days after the appearance of this advertisement Canvassing disqualifies

R E RICHARDSON
Director of Education

Education Office

Grimsby

MANCHESTER MUNICIPAL COLLEGE OF TECHNOLOGY

(FACULTY OF TECHNOLOGY IN THE UNIVERSITY OF MANCHESTER)

SENIOR LECTURER IN PAPER-MAKING TECHNOLOGY

The Governing Body invites applications for an appointment as Senior Lecturer in Paper-Making Technology with similar title and status in the University Candidates should be graduates in science or technology who have had extensive research experience with fibres The successful applicant will be expected to devote himself to research lecturing and the organization of the paper-making section of the Textile Chemistry Department He will be under the general supervision of the Head of the Department of Textile Chemistry The paper-making section is housed in new laboratories in the extension of the College Salary scale £1 400 to £1 750 by annual increments of £50 The starting salary may be anywhere within this scale depending on the qualifications and experience of the applicant Superannuation under the F S S U and family allowances

Conditions of appointment and form of application may be obtained from the Registrar, College of Technology Manchester 1 The last day for receipt of application is March 31, 1955

B V BOWDEN
Principal of the College

MINISTRY OF SUPPLY REQUIRE PHYSICAL Chemist and/or Physicists for following posts at Royal Aircraft Establishment, Farnborough Hants (1) Physicist with good background in mathematics to work on properties of materials with particular reference to aircraft. Candidates should have an interest in physical and mechanical testing in development of suitable test methods and in properties of materials generally (2) Physicist or Physical Chemist with an interest in properties of materials for work on development of fibre in reinforced products with particular reference to use in aircraft A knowledge of plastics industry would be an asset Qualifications higher school certificate (science) or equivalent Some interest in engineering may be an advantage Appointments as Assistant Experimental Officer with salary range £288 10s (age 18) to £640 Women somewhat less Possibilities of promotion to higher grades Not established but opportunities to compete for establishment may arise—Application forms from Ministry of Labour and National Service Technical and Scientific Register (K) 26 King Street London S W 1 quoting A51/5A Closing date March 29, 1955

CHEMICAL ENGINEER REQUIRED BY THE National Research Development Corporation to join a team engaged in research connected with the design and development of multimembrane electrodialysis cells and to supervise the construction of semi-technical scale demonstration plant Applicants should be between 24 and 30 years of age and should hold a degree in chemical engineering or physical chemistry with at least two years' postgraduate experience The appointment is tenable at the Low Temperature Research Station, Cambridge and is for two years in the first instance Initial salary £700 to £900 according to experience The conditions are similar to those attaching to Research Fellowships—Application giving full details of qualifications should be made to the Superintendent, Low Temperature Research Station Downing Street, Cambridge

---

YORKSHIRE OUSE RIVER BOARD

Applications are invited for the appointment of Biologist in the Chief Inspector s Department at a salary in accordance with Grade III of the National scales (£600 to £725 per annum) Candidates should possess a degree in biology with chemistry as a subsidiary subject and have had previous experience in freshwater biology The appointment will be subject to the Local Government Superannuation Acts and the National Joint Council's Scheme of Conditions of Service and will be terminable by one month s notice on either side

Applications, stating age, qualifications and previous experience and accompanied by copies of not more than two recent testimonials should be sent to the Chief Inspector Yorkshire Ouse River Board, 21 Park Square South, Leeds 1, within fourteen days of the appearance of this advertisement Canvassing, either directly or indirectly will disqualify

A W WOOD
Clerk and Solicitor of the Board

21 Park Square South
Leeds 1

UNIVERSITY OF LEEDS

DEPARTMENT OF MINING

The Council invites applications for two Lectureships in the Department of Mining one in Dressing of Minerals and the other in Surveying the salary scale is at present under review Candidates for the Lectureship in Dressing of Minerals should be experienced in the design and operation of different types of plant and for the Lectureship in Surveying in topographical surveys

Applications (three copies) stating date of birth qualifications and experience, together with the names of three referees should reach the Registrar The University Leeds 2 (from whom further particulars may be obtained) not later than March 18 1955

UNIVERSITY OF SOUTHAMPTON

Applications are invited for the post of Research Assistant in Ecology (second appointment) established under Nature Conservancy grant for investigations into competition between fen dominants in the Norfolk Broads Requirements include a first- or good second-class degree in botany with ecological and physiological interests The appointment is for three years and work for a higher degree is permitted Salary £375 per annum plus £75 per annum travelling allowance

Further particulars from the Secretary and Registrar, University of Southampton Closing date March 26 1955

UNIVERSITY OF MANCHESTER

Applications are invited for an Assistant Lecturer in Botany Candidates should have special interests in mycology Salary on a scale £450 to £550 per annum with membership of F S S U and children s allowance scheme (salary scales at present under review)

Forms of application and further particulars may be obtained from the Registrar The University, Manchester 13 to whom applications should be sent as soon as possible but not later than March 16 1955

BATTERSEA POLYTECHNIC

LONDON S W 11

Applications are invited from honours graduates of a British university for the post of Grade B Lecturer in Physics Salary £621 or £633 by £25 to £928, plus allowance of £30 for a good honours degree a training allowance and increments for industrial or research experience

Further particulars from the Clerk to the Governing Body by whom application should be received as soon as possible

---

BRITISH TRANSPORT COMMISSION RESEARCH Department (Railways), a vacancy exists at Derby for a Scientific Officer Grade I, salary range £850 to £950 Candidates must possess a good degree in physics The post offers a wide scope in problems involving classical physics, and applicants should indicate in which direction their particular interest lies Superannuation and certain free travel facilities—Applications to Director of Research (Railways) Staff Section, 222 Marylebone Road London N W 1

UNIVERSITY OF LONDON, KING'S COLLEGE will require on October 1 1955, two Lecturers in Physiology one to replace a member of staff recently appointed to a chair The salary will be at a point on the scale £900 by £100 to £1 200 with family allowances and F S S U benefits—Particulars and application forms should be obtained from the Registrar King s College Strand, W C 2 whom completed applications should reach by March 28, 1955

MEDICAL RESEARCH COUNCIL

Applications are invited for the post of Research Assistant in the Climatic and Working Efficiency Unit of the Medical Research Council at the Department of Human Anatomy in the University of Oxford, to take part in fundamental studies of muscle and joint action and the application of this to clinical, industrial and service problems Candidates should have a medical degree or an honours degree in physiology or zoology The salary will be dependent on qualifications and experience Superannuation provision will be made under the Federated Superannuation System for Universities

Applications, giving age, qualifications, experience, list of published work and copies of testimonials, should reach Professor Sir Wilfrid Le Gros Clark, F R S, Department of Human Anatomy, University Museum, Oxford, not later than April 30, 1955

UNIVERSITY OF READING

DEPARTMENT OF AGRICULTURAL BOTANY

Applications for the post of Assistant Lecturer in Agricultural Botany are invited from honours graduates in botany or agricultural botany, and from those who expect to obtain such a degree this summer The appointment will be for three years The salary will be within the range from £550 per annum to £650 per annum, F S S U and child allowance

Further particulars may be obtained from The Registrar, by whom applications should be received not later than April 30, 1955

LIVERPOOL RADIUM INSTITUTE MANAGEMENT COMMITTEE

1 MYRTLE STREET, LIVERPOOL, 7

Applications are invited for the post of Hospital Physicist, Senior Grade, first- or second-class honours degree essential Whitley Council scales and conditions of service

Applications, giving qualifications and experience, together with names and addresses of two referees, should reach the undersigned not later than March 15, 1955

D BRYSON,
Secretary to the Committee

UNIVERSITY OF SHEFFIELD

Applications are invited for a post of Research Assistant to the Professor of Mining, to begin duties as soon as possible Salary up to £750, with F S S U provision and family allowance Applicants should have a good degree in mining, engineering or pure science

Further particulars should be obtained from the Registrar, to whom applications (four copies) should be sent by March 26, 1955

BRITISH ELECTRICITY AUTHORITY, Yorkshire Division, require an Assistant Chemist in the Fuel Section of the Divisional Chemical Laboratory, sited at Skelton Grange Power Station, Leeds Salary will be within the range £600 to £725 per annum, Grade 6 Class AX N J B Agreement Schedule C, according to qualifications and experience and will rise ultimately to a maximum of £805 per annum Applicants should hold higher national certificate in chemistry or its equivalent and have had previous experience associated with the sampling and analysis of fuel and related work —Application forms, obtainable from Divisional Secretary (Establishments) British Electricity House, St Mary's Road, Leeds 7, to be returned within fourteen days of the appearance of this advertisement

G A VOWLES,
Divisional Controller

AERODYNAMICISTS AND AERONAUTICAL Engineers required at Research and Development Establishments of Ministry of Supply at Amesbury, Wilts, Farnborough, Hants and London H Q Research or experimental experience of aircraft problems desirable Prospects of promotion Not established but opportunities to compete for establishment may arise Qualifications, Scientific Officer Class, first- or second-class honours degree or equivalent Experimental Officer Class, higher school certificate (science) or equivalent, but higher national certificate, G R Ae S, pass degree, etc, may be an advantage Appointments and salary according to age, research experience, etc, as Scientific Officer, within range £467 10s to £845, Experimental Officer (minimum age 26), £715 to £880, Assistant Experimental Officer £288 10s (age 18) to £640 (London rates £14 to £40 higher) Women somewhat less F S S U benefits may be available for Scientific Officer grade —Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K) 26 King Street, London, S W 1 quoting C 84/5A

COMMONWEALTH of AUSTRALIA

AUSTRALIAN ATOMIC ENERGY COMMISSION

APPLIED MATHEMATICIAN OR MATHEMATICAL PHYSICIST

Applications are invited for two such positions (a) Research Officer in the salary range £A 1,184 to £A 1,730, to carry out theoretical calculations in connection with nuclear reactor design, and (b) Principal Research Officer in the salary range £A 2,228 to £A 2 588 (or for an exceptional applicant, Senior Principal Research Officer in the range £A 2,678 to £A 3,000) to originate theoretical work in the field of nuclear reactor design Appointees will be required to work outside Australia initially Details of the terms and conditions of appointment, allowances, superannuation and the general structure and scope of the Commission are available from the undersigned or from the Commission's Liaison Officer, Australia House, Strand, London, W C 2

Applications, with relevant personal particulars, qualifications, war service and names of referees, should be sent by May 2, 1955, to The Secretary, Australian Atomic Energy Commission, 45 Beach Street Coogee, New South Wales, Australia

---

UNIVERSITY OF ALBERTA

FACULTY OF AGRICULTURE

Applications are invited for the position of Assistant Professor of Soil Science, duties to commence on September 1, 1955 Initial salary $4,000 to $5,000, depending on qualifications and experience There is a cost-of-living bonus of about $300, and the normal yearly increment is $250 Preference will be given to a university graduate, with a Ph D degree or equivalent training, who has specialized in soil science Duties will include research, teaching, soil testing, and extension work in soil science Confirmation of the appointment will be subject to the satisfactory completion of a probationary period of two to four years

Applications should be addressed to the Head of the Department of Soil Science, Faculty of Agriculture University of Alberta, Edmonton, Alberta and should give details of training and experience, personal information, the names of three referees, and be accompanied by a recent photograph Closing date May 1 1955

ROTHAMSTED EXPERIMENTAL STATION

HARPENDEN, HERTS

Assistant Experimental Officer (male) required in the Botany Department, to help in field work on the physiological analysis of growth and yield of agricultural crops, and in related laboratory work Applicants should be graduates in botany or agricultural botany, with training in plant physiology and preferably some knowledge of modern methods of field experimentation Commencing salary, according to age, up to £512 per annum at age 26 Superannuation scheme

Applications, quoting reference 102, with names of two referees, should reach the Secretary by March 21, 1955

BRITISH EMPIRE CANCER CAMPAIGN invites applications from suitably qualified British subjects for Exchange Fellowships in cancer research during 1955-56 Fellowships are of one year's tenure in North America at a stipend of $4,000 per annum, which will be paid by the National Cancer Institute of Canada to Fellows proceeding to Canada, and by the American Cancer Society to Fellows proceeding to the United States Travelling expenses to and from centre of work will be borne by the Campaign The closing date for the receipt of applications is March 31, 1955 —For further particulars and application forms apply to the Secretary General, British Empire Cancer Campaign, 11 Grosvenor Crescent Hyde Park Corner, London S W 1

A VACANCY EXISTS FOR A PHYSICIST with a minimum of two years' hospital experience for work in the Radiotherapy Departments of St Bartholomew's Hospital and the North Middlesex Hospital, Edmonton Salary scale £585 by £30 to £765, plus London weighting, starting salary will be based on previous experience —Write in the first instance by March 11, 1955, enclosing two copies of testimonials to C C Carus-Wilson, Clerk to the Governors St Bartholomew's Hospital London, E C 1, marking envelope "Physicist"

BIOCHEMISTRY GRADUATE, PREFERably with some research experience, required for investigations on red-cell enzymes Salary up to £700 per annum, according to qualifications —Applications by April 15, 1955 Further details from the Regional Director Blood Transfusion Service, Royal Infirmary, Edinburgh, 3

BRITISH IRON AND STEEL RESEARCH ASSOCIATION

Graduate is required by the Fuel Technolo Section of the Physics Department of the abo Association to undertake research of a varied a interesting nature, and which in the first insta will be mainly in connection with problems heating and cooling of steel The post will centred at London but will entail operatio studies at steel works Candidates should have degree in technology, science or engineering a preferably some experience of problems of steady heat flow Starting salary up to £775 annum, according to age, qualifications and perience Post is superannuated under F S S U

Written applications only, quoting "Fuel Te nology," to Personnel Officer, B I S R A, Park Lane, London, W 1

FOOT-AND-MOUTH DISEASE RESEARCH INSTITUTE

Applications are invited for a post of Resea Assistant (female) Duties are concerned w research on serology of viruses Qualificatio should preferably include B Sc (bacteriolog The post is superannuable and salary in acco ance with nationally agreed scales related to a qualifications and experience These are Assist Experimental Officer grade (£372 at age 21, risi by eight increments to £540) or Scientific Offi grade (£467 by ten increments to £750)

Applications, stating age, qualifications, deta of past and present appointments and acco panied by the names of three referees, should addressed to the undersigned immediately

N SMITH,
Secreta

Pirbright, Surrey

BRITISH IRON AND STEEL RESEARCH ASSOCIATION

Physicist required, for work in the Flu Dynamics Section of the Physics Department the Association's Laboratories in London Ca didates should have a degree in physics, with p ferably some industrial or research experienc Work will be mainly on the treatment of gas and aerosols Starting salary up to £750 p annum, according to age, qualifications and e perience Post is superannuated under t F S S U

Written applications only quoting "Flu Dynamics," to the Personnel Officer, B I S R 11 Park Lane, London, W 1

ROTHAMSTED EXPERIMENTAL STATION

HARPENDEN, HERTS

Applications are invited for the post of He of the Department of Entomology The a pointment will be in the Senior Principal Scie tific Officer grade (£1,600 by £75(3) by £25 £1,850) Superannuation F S S U The succe ful applicant will be required to take up du on October 1, 1955

Applications, together with names of two pe sons to whom reference may be made, sho reach the Secretary by March 31, 1955

INSTITUTE OF UROLOGY

IN ASSOCIATION WITH ST PETER'S, ST PAUL'S AND ST PHILIP'S HOSPITAL

Full-time Biochemist (science degree or medic qualifications essential) required for work in co nection with urological disease Experience routine biochemical tests and an interest in r search necessary The post is of senior grad and Whitley Council scales will apply

Apply, Secretary, Institute of Urology, 10 He rietta Street, W C 2, stating age, qualificatio and experience, and enclosing copies of tw recent testimonials Closing date March 1 1955

UNIVERSITY OF CAMBRIDGE

Applications are invited for the office of Read in Industrial Management which has recently bee established in the Department of Engineering

Forms of application and further particula may be obtained from the Secretary General the Faculties, The Old Schools, Cambridge T closing date for the receipt of applications April 9, 1955

BACTERIOLOGIST OR MICROBIOLOGIS required for production work at Lister Institu of Preventive Medicine, Chelsea Bridge Roa London, S W 1 Previous experience desirab but not essential Salary according to qualifica tions and experience —Apply in writing, givi age and details of training, to the Secretary at t above address

UNIVERSITY OF READING

RESEARCH FELLOWSHIPS

Applications are invited for one or more Rerch Fellowships, for independent research, value 0 per annum

Full particulars may be obtained from the gistrar, to whom applications should be forrded by April 12, 1955

UNIVERSITY OF LONDON

Applications are invited for Turner and Newall search Fellowships in Engineering, Inorganic emistry, Physics or an allied subject, tenable m October 1, 1955, normally for three years the first instance Salary not less than £750 r annum, with family allowances and F S S U Information and application forms can be tained from the Academic Registrar University London, Senate House, W C 1 Applications st be received not later than April 16 1955

UNIVERSITY OF ABERDEEN

Senior Technician required for Clinical Chemry Department, Foresterhill, Aberdeen Wage scale £490 by £20 to £590, placing according qualifications and experience

Applications, in writing, to the Secretary, arischal College Aberdeen

---

UNIVERSITY OF NOTTINGHAM

Laboratory Technician, with experience, reired for the Chemistry Department Salary ale £440 to £480 per annum Annual leave enty-one working days Voluntary superannuan scheme

Application by letter to the undersigned

H PICKBOURNE,
Registrar

SENIOR TECHNICIAN REQUIRED AS ssistant to Laboratory Superintendent Must be nversant with requirements of large research hool engaged on problems connected with all anches of chemistry Skill in laboratory arts d experience of laboratory maintenance essenl Wage according to university technical resed scale Grade B—Apply, The Laboratory perintendent, Chemistry Department, The Unirsity, Edgbaston, Birmingham, 15

LABORATORY TECHNICIAN REQUIRED assist chief steward Experience in general boratory technique desirable Salary £340 to 80, according to age and experience—Applicans, with references, in writing to Mr W A ightman, Department of Organic Chemistry, he University, Leeds, 2

READER AND SENIOR LECTURERS OR ecturers in Physics—The Dean, College of Arts d Science, Baghdad, Iraq

APPOINTMENTS VACANT

IMPERIAL CHEMICAL INDUSTRIES imited Billingham Division, has several interestg vacancies for Physicists The Division has n expanding research programme and requires hysicists to carry out work on the development f physical methods and techniques and their aplication to chemical problems and analytical ethods There is also a requirement for Physists or Electrical Engineers who have made a road study of instrument technology or who wish take up work in the fields of instrument deelopment and management Candidates should e not more than 35 years of age and hold an onours degree Starting salaries will depend pon qualifications and experience—Write, giving ll details of age, qualifications and experience the Staff Manager, Imperial Chemical Induses Limited, Billingham Division, Billingham o Durham, quoting reference F 9

GRADUATE (CHEMIST OR PHARMACIST) quired for analytical work in Control Laboraory of pharmaceutical manufacturers The work fers a variety of experience in modern pharmautical analysis and control procedures Precus experience will be an advantage but applitions are also invited from persons recently alified A non-contributory pension and life surance scheme is in operation—Application rms from Eli Lilly and Company, Limited, asingstoke, Hampshire

---

IMPERIAL CHEMICAL INDUSTRIES LTD, as a vacancy for a Techno-commercial Assistant one of its subsidiary companies in the Far ast Candidates should be single not more an 30 years of age and must possess a degree chemistry Remuneration according to age d qualifications—Application should be made the Recruitment Section, Central Staff Departent, Imperial Chemical House, Millbank, Lonn, S W 1

GLAXO LABORATORIES LTD

Glaxo Laboratories Ltd invite applications from graduates in one of the biological sciences for two posts at their Stoke Poges Research Laboratories The work of one of the posts involves research into biochemical and immunological aspects of the preparation of virus vaccines and the other the tissue culture propagation of viruses Postgraduate experience is a necessity for both posts

Those interested should write to Personnel Manager, Glaxo Laboratories Ltd, Greenford, Middlesex

---

TECHNICAL ABSTRACTOR / STENOgrapher required by London Office of U S A Chemical Company Good knowledge of chemistry, German, French and typing is required Shorthand an advantage Five-day week, attractive salary would be paid—Write, giving full particulars to Box No 657, T G Scott and Son Ltd, 143-147 Regent Street, London W 1

BRITISH INSULATED CALLENDER'S Cables, Ltd invite applications for the following vacancy at their Leigh Works, near Manchester Graduate Physicist or Electrical Engineer for the Electro-Physical Laboratory The work involves the study of electrical properties of rubber and synthetic insulating materials under a wide range of physical conditions Investigational work relates to the performance of experimental cables embodying new and improved designs Candidates should have an interest in the practical use of all types of electrical measuring equipment, but previous industrial experience is not necessary—Applications, quoting reference A/26/54, should be addressed to the Staff Officer, B I C C, Ltd, Prescot, Lancs

---

ASSISTANT, PREFERABLY WITH LABORAtory experience required for research on behaviour of packaging materials under shock Use of electronic equipment will be involved Salary within range £250 to £520, according to experience Five-day week—Application forms from Secretary, Printing, Packaging and Allied Trades Research Association, Randalls Road, Leatherhead, Surrey (Ref CM/2/2/1955)

METALS RESEARCH APPLICATIONS INvited from men with degree (or equivalent) for positions in Welding and Ferrous Sections of the Birmingham Laboratory of the Mond Nickel Co, Ltd Fields of investigation extremely broad, including (a) studies of techniques and metallurgy of the welding of corrosion-resistant and creep-resistant materials, and (b) properties of low and high alloy steels Positions suited to men with initiative and energetic temperament—Apply, stating age, qualifications, experience and salary required, to Manager, D and R Dept, The Mond Nickel Co Ltd Sunderland House, Curzon Street, London, W 1 Mark envelope "Confidential L 21"

JOSEPH LUCAS, LIMITED, HAVE AN INteresting vacancy in their research and development laboratories which would be suitable for a young graduate with honours degree in mathematics or physics The work is largely of a fundamental nature, and is concerned with acoustics and mechanical vibrations Previous industrial experience is not necessary—Please reply, giving qualifications, age, and any other relevant details to Personnel Manager, Joseph Lucas (Electrical), Ltd, Great King Street, Birmingham quoting reference PM/D/59

A GRADUATE IS REQUIRED FOR BASIC and applied research on the machining and cold forming of metals A good degree (or equivalent qualification) in engineering, science or metallurgy is required There are good prospects for advancement Commencing salary commensurate with qualifications and experience Pension scheme—Send full details, including age, experience, qualifications and present salary in confidence to Box 649 T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

BRITISH NYLON SPINNERS LIMITED REquire an Information Assistant in their Library and Information Section The work will be varied and includes indexing of technical literature and the making of literature surveys The minimum qualification is general certificate of education, advanced level, with chemistry as one subject, but persons with higher qualifications or experience in a technical library will be given preference The appointment is permanent and pensionable Five-day week—Apply in writing to Personnel Manager, Pontypool Mon

---

TUBE INVESTMENTS RESEARCH LABORATORIES

HINXTON HALL, CAMBRIDGE

Tube Investments, Limited, have set up long range Research Laboratories near Cambridge to study fundamental problems in the general fields of physics, chemistry metallurgy, electronics and engineering A senior graduate directly responsible to the Director of Research, is required to organize and co-ordinate the technical aspects of the greatly expanding programme of the laboratories, and the provision of laboratory and engineering facilities and services Salary according to qualifications and experience

---

TECHNICAL LIBRARIAN

WOMAN

Courtaulds Limited require a technical librarian (woman) for a new research laboratory at Coventry Candidates should have a knowledge of chemistry to degree standard and previous experience in an industrial technical library

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the reference number D 60

DENIS FERRANTI METERS LIMITED

BANGOR, NORTH WALES

Due to expansion of Design Laboratories a vacancy exists for an Assistant Chief Engineer A good degree and senior experience in the design of aircraft instruments or armaments essential, specialized knowledge of gyroscopes and/or servo systems would be an additional qualification Excellent prospects in expanding concern situated in North Wales coastal centre Assistance given, if desired, in obtaining accommodation

Applications, in confidence, to Chief Engineer

CHEMIST

HONOURS GRADUATE

Courtaulds, Ltd, has a vacancy in its Textile Research Laboratory at Bocking, Essex for a Graduate Physical Chemist who is interested in the basic physical problems of textile chemistry and is prepared to contribute original ideas in a developing situation Applicants should possess an honours degree and have had practical experience of research methods Age 25 to 33

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Ltd, 16 St Martin s-le-Grand, London, E C 1 quoting the reference number D 64

RESEARCH AND DEVELOPMENT

Courtaulds Ltd invite applications for the following vacancies in their Research and Development Laboratories Bocking, Braintree, Essex Graduate Textile Technologist, age 27-32 with industrial experience to work on textile dyeing and finishing Ref No D 61 Graduate Textile Technologist, to work on Research and Development in the field of textile manufacture Ref No D 62 Graduate Chemist, age 33 or less, for work on textile sizing Ref No D 63

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds Limited 16 St Martin's-le-Grand, London E C 1, quoting the appropriate reference number

---

LADY CHEMIST, GRADUATE OR H N C required for analysis of electroplating and allied solutions—Apply, Electro-Chemical Engineering Co Ltd 161 Queens Road Weybridge Surrey

---

T & H SMITH LTD HAVE A VACANCY in their works at Edinburgh for a qualified pharmacist or chemist, under 35 years of age, for interesting work in connection with the development and production of allergy preparations Superannuation scheme in force—Apply, giving full personal particulars to Works Director, T & H Smith Ltd Blandfield Chemical Works, Wheatfield Road Edinburgh 11

ALLEN & HANBURYS LTD, WARE Herts, require Research Chemist, organic, for Research Laboratories Candidates should have at least first- or second-class honours, or M Sc, and should be under 30 Previous experience in organic synthesis desirable but not essential The position is permanent, progressive and superannuated Five-day week—Apply, Personnel Manager

---

GRADUATE CHEMIST METALLURGIST or Chemical Engineer required to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel—Apply, Electro-Chemical Engineering Co, Ltd 161 Queens Road Weybridge Surrey

MULLARD RESEARCH LABORATORIES in Surrey have a number of vacancies for Physicists and Electronic Engineers with a good degree or equivalent qualification for work in a variety of projects, including

(1) SOLID PHYSICS AND SEMI-CONDUCTORS

(2) MAGNETIC MATERIALS AND APPLICATIONS

(3) MICROWAVE TECHNIQUES

(4) ADVANCED ELECTRONIC CIRCUIT TECHNIQUES INCLUDING TRANSISTOR APPLICATIONS

(5) COLOUR TELEVISION

(6) COMPUTORS AND SERVO-MECHANISMS

Some years' experience in one or more of these fields is desirable, but recent and prospective graduates are also invited to apply Mathematics graduates with experimental leanings are not excluded

Successful applicants will join teams engaged on research and advanced development projects Publication of original work wherever possible is encouraged

Salaries are based on qualifications, experience and age, and are in keeping with present-day levels General prospects within the organization are excellent

Apply to Personnel Officer, MULLARD RESEARCH LABORATORIES Cross Oak Lane, Salfords near Redhill, Surrey, quoting reference E R L

ENGINEERS BRITISH NYLON SPINNERS Limited would be interested to receive applications from Engineers for several appointments which are to be filled in the near future The duties will be in applied experimental work and will be of exceptional interest to mechanical engineers who can make the most of opportunities for original thought and application Sound general experience in mechanical engineering is called for, with a bias towards experimental work , and one of the appointments requires a wide experience in instrumentation In every case a good university degree is a desirable qualification followed by an apprenticeship and at least three years' industrial experience Inquiries are invited now, whether or not candidates are immediately available, and the fullest information will be given to those asked for interview, such interviews carry no obligation, but will enable candidates to meet the company's Chief Engineer and his staff and to measure at first hand the technical interest and career prospects —Apply in writing to Personnel Manager, Pontypool, Mon

---

INSTRUMENT DEVELOPMENT AN EXpanding programme of work has created new vacancies for development staff, to work on a wide variety of scientific investigations and instruments Applications are invited from qualified electronic and mechanical engineers, physicists and chemists preferably with some industrial experience —Write, giving full details and stating salary required Nash and Thompson, Limited, Oakcroft Road, Tolworth, Surrey

---

THE RESEARCH LABORATORY OF THE British Thomson-Houston Co Ltd require a Graduate in Metallurgy or Physics to join an expanding group working on the strength of metals, with particular reference to high temperature properties —Apply, quoting reference HJ and stating age, qualifications and experience to the Director of Research, The British Thomson-Houston Co Ltd , Rugby

---

APPLICATIONS ARE INVITED FROM physicists with honours degrees or their equivalent, for posts in the research laboratory of the British Thomson-Houston Co , Ltd The work involves investigations of photo-conductive materials and devices, but previous experience in this field is not essential —Apply, quoting reference WNB, and stating age, qualifications and experience, to the Director of Research, The British Thomson-Houston Co , Ltd , Rugby

---

MECHANICAL AND CHEMICAL ENGINEERS

Courtaulds, Limited, Chemicals Division, requires two graduate Mechanical Engineers and one Chemical Engineer for investigational and development work near Manchester The work is of an original nature in connexion with the development of chemical plants and processes for which a real interest in, and potential talent for, engineering development work as applied to large-scale chemical plant is of paramount importance The Mechanical Engineers must have served an apprenticeship for at least two years and all candidates must have had practical works experience Honours degree men preferred Age 25 to 35

Candidates should write for a detailed form of application to the Director of Personnel Courtaulds, Limited, 16 St Martin's-le-Grand, London, E C 1 quoting the reference number H8 for Mechanical Engineers and H 9 for the Chemical Engineer

---

ASSISTANT CHEMIST REQUIRED A permanent progressive post is being created by an old-established, universally known Slough Company for a young man of ability, aged about 25 Under the direction of the Chief of Research his duties and scope will be wide and varied involving the control of industrial processes, electroplating, industrial research, etc This post is a responsible one demanding an enthusiastic worker with qualifications up to higher national certificate, higher school certificate, or Inter B Sc Some laboratory experience is essential Practical ability and a bent for works control are more important than academic honours Salary will be according to age, qualifications and experience, with good prospects of advancement Excellent working conditions, five-day week, pension scheme about to be introduced —Apply Box 659, T G Scott and Son, Ltd , 143-147 Regent St , London, W 1

CHEMIST REQUIRED FOR REsearch work on inorganic chemicals and metal extraction Applicants should have B Sc or A R I C , and some research experience would be preferred Permanent appointment with pension and life assurance Apply, stating reference NC F15, and details of age, qualifications and experience to

Personnel Officer (Staff),
Magnesium Elektron Limited,
P O Box No 6, Lumm's Lane,
Clifton Junction, Swinton,
near Manchester

THE RESEARCH DEPARTMENT OF A leading industrial organization situated in the south requires two graduates to undertake the expansion of an important research project connected with the raw materials of the industry The work involved, which offers ample scope for initiative and imagination, will appeal to organic chemists and biochemists who are interested in fundamental research on natural products and in applying the results of this research to the agricultural and manufacturing practices of the industry Applicants must have a first- or second-class honours degree and some postgraduate experience would be useful, although not essential The appointments will be to the regular staff and will be pensionable with starting salaries according to age and experience within the range £700 to £1,100 —Applications, giving full particulars will be treated in confidence Box No T 6208 Haddon's, Salisbury Square, Fleet Street, E C 4

THE LIBRARY OF A LARGE GROUP OF Chemical Manufacturing Companies requires a graduate in chemistry for information work Duties will include searching, summarizing, translating and abstracting chemical and patent literature, preparing subject surveys and reports, and obtaining technical information for the Research, Chemical Engineering and Sales Departments Ability to translate fluently chemical material from German and at least one other language is essential—knowledge of other languages would be an advantage The library is situated 30 miles north of London Applicants should be under 30 years of age, and be British subjects by birth —Write Box N 937, c/o 191 Gresham House, E C 2

CHEMICAL LABORATORIES OF PLANT Protection Limited, Yalding, require a young man aged about middle 20s of Inter B Sc standard for work on chemical formulation problems associated with crop protection —Applications to Technical Department, Plant Protection Limited, Yalding, Kent stating full particulars

---

THE DISTILLERS COMPANY, LIMITED

A Physicist or Physical Chemist, interested in the mechanical and electric properties of high polymers, is required a the Research and Development Department, Epsom, Surrey Duties would involve supervision of testing of a wide rang of experimental plastics, fibres and rubbers development of new test methods, an fundamental research on visco-elastic properties of polymers A good honour degree would be a minimum qualification previous experience in the field mentioned though desirable, is not essential This i a progressive post with excellent opportunities for the right person

Apply, Staff Manager, The Distillers Co Ltd , 21 St James's Square, London S W 1 Ref 10/55

A SCIENCE GRADUATE WHO IS INT ested in a progressive career in modern manu turing is required by a large and growing c pany with chemical interests During the last years the company has met its expansion n by the introduction of graduates of progres outlook who wished to make a career in moc industry, and who wished to develop in managerial and executive field without lo touch with technical matters Most of these i have read chemistry but it has appealed also the engineer or physicist who wished to veer a from the purely technical field The initial p tion, after training, will be the management c small process or production department position will be clearly defined in both respo bility and authority, and will be preceded by c ful training under senior graduate members T training will be continued long enough to ens the position is taken over with confidence T other positions of a similar nature will be av able later in the year and applications from terested graduates taking finals this summer, from men in the Services, will be considered n Upper age limit 27 years Commencing sal £650 to £850, depending upon the candida background, and this will be paid during the tr ing period At the end of training full scope be given for the use of ability and initiative progress will be related solely to merit All se positions are, without exception, filled from w in the company Strict confidence will be served —Please forward a brief outline of ba ground, etc , to Box 648, T G Scott and S Ltd , 143-147 Regent Street, London, W 1

YOUNG GRADUATE IN CHEMIST with physical or engineering bias required research and development of new cera materials and technical control of producti This is a new and interesting field offering gc prospects Commencing salary in the order £500 to £600 per annum, or more, according merit —Apply in writing to Neosid Ltd , Sto hills House, Welwyn Garden City, Herts

---

THE BRITISH LEATHER MANUF turers' Research Association requires an exp enced laboratory steward to undertake storeke ing and maintenance of laboratories Knowle of electrical and instrument work would be advantage Five-day week , staff cante pension scheme after one year's service Sal according to age and experience —Apply in w ing in the first instance, to The Direct B L M R A , Milton Park, Egham, Surrey

---

SENIOR PHYSICIST REQUIRED initiate a Nuclear Physics section in a w equipped research laboratory Location in Nor amptonshire —Box 661, T G Scott and Son, Lt 143-147 Regent Street, London, W 1

METALLURGIST IS REQUIRED FOR I vestigation of problems in the field of physi metallurgy The vacancy would suit a rec graduate · one or two years' industrial or search experience would be an advantage, but not essential —Applications should be address to the Director of Research, Aluminium Labo tories, Limited, Banbury Oxon

EEL COMPANY OF WALES LTD
(STEEL DIVISION)
PORT TALBOT
INVITES

lications from suitably qualified young men,
have completed their National Service, for
umber of posts in their Operational Research
partment

he Company operates the largest and most
dern integrated Steel Plant in Europe and is
expanding The plant is laid out on the
th Wales seaboard in spacious and pleasant
roundings with ideal working conditions Good
dential areas are reasonably close to the
rks

he Operational Research Department engages
the investigation of a wide range of stimulat-
problems concerned with all aspects of the
iency and development of a complex plant
re is ample scope for originality of approach
initiative

n attractive pension scheme is in operation

emoval expenses will be paid for a married
n to a maximum of 5 per cent of annual salary

acancies are available for

One PHYSICIST with a good honours degree preferably some industrial experience Starting salary in the range of £700 to £900

One STATISTICIAN with an honours degree in Mathematics and a few years experience Salary in keeping with experience and qualifications

Three or Four GRADUATES in either Science or Engineering who seek to apply their training to industrial problems Starting salary in the range of £550 to £650

Those wishing to apply should *write for official Application Form* to the

Personnel Superintendent
The Steel Company of Wales Limited,
P O Box No 3,
PORT TALBOT, Glam

MPERIAL CHEMICAL INDUSTRIES
nited seeks to fill the following vacancies in
earch work (1) A young woman honours
duate who has specialized in Zoology or pos-
ly Microscopic Botany The appointment will
concerned with Histopathological work in con-
tion with Chemotherapeutic Research (2) A
teriologist with a veterinary qualification The
ointment is concerned with research on the
motherapy of animal diseases Previous re-
rch experience is essential and preference will
given to candidates between 30 and 35 years
age (3) Organic Chemists to conduct Chemo-
rapeutic Research Candidates should hold a
D degree or have had an equivalent research
ring and should be under 30 years of age (4)
Biochemist to conduct research in the field of
motherapy Candidates should hold a Ph D
ree or have had an equivalent research train-
and should be under 30 years of age The
mpany's Research Laboratories are at present
ated in the North Manchester area but new
oratories are now in the course of erection in
rural area about twenty miles south of Man-
ster—Applications, with full particulars should
addressed to the Staff Manager, Imperial
emical (Pharmaceuticals) Limited, Fulshaw
ll Wilmslow, Manchester

QUALIFIED AND EXPERIENCED RE-
rch chemist required by food manufacturers in
Edinburgh district—Applications in full, stat-
qualifications and experience to Box 660,
G Scott and Son, Ltd, 143-147 Regent Street,
ndon, W 1

LANKRO CHEMICALS LIMITED OF
les Manchester, offer an unusual opportunity
h considerable scope for a highly qualified
mist of proven ability Applications are in-
d for the post of Senior Research Chemist
high standard in organic chemistry with keen
erest in physical chemistry and at least five
rs' industrial experience are required Some
ministrative experience is desirable The com-
y manufactures plasticisers, surface active
micals and auxiliaries for the leather and
tile industries Salary will be by negotiation
d a contributory pension scheme is in opera-
—Applications giving full particulars, should
addressed to The Managing Director

ALLEN & HANBURYS LTD, WARE,
rts require Assistant Chemists, preferably of
er science standard, for their Organic Re-
arch Laboratories Opportunity for further
dy is available Five-day week—Apply Per-
nnel Manager

NUCLEAR REACTOR PROJECT DESIGN STUDY GROUP

A unique opportunity is offered to young men with initiative and imagination, to study nuclear power and propulsion

Applications are invited for the following posts

(1) PROJECT ENGINEER, to carry out feasibility studies on small high temperature system Background in aero-engine design would be an advantage Knowledge of heat transfer and fluid dynamics essential

(2) RESEARCH METALLURGIST, to engage in research on new materials Some knowledge of high temperature alloys, ceramics or liquid metals would be an advantage

(3) PHYSICIST, to engage in experimental research on existing reactors and assist in nuclear design calculations on new types

Some knowledge of nuclear physics is desirable for (3), but is not essential for (1) and (2)

Honours degree or equivalent qualifications essential

Age 23 to 30 years

Initial salary up to £1,000 per year, depending on age and experience

Reply, giving full details of career to Box 658, T G Scott and Son Ltd 143-147 Regent Street, London W 1

RESEARCH CHEMISTS AND PHYSICISTS with university degrees or equivalent and Research Assistants with Inter B Sc or general certificate of education in science subjects are required urgently by the Central Research Department of The Morgan Crucible Co Ltd to take part in various projects of a varied and interesting nature Scope exists for scientists interested in the relatively little-explored field of reactions between materials at temperatures between 1,200° C and 2,500° C in powder metallurgy, in the field of semi-conductors, in the development of new physical testing methods, and in special problems associated with the physics and chemistry of carbon, graphite, refractory oxides, silicon carbide and metal-ceramics The laboratories of the department employ 100 people and are modern and excellently equipped Applicants called for interview will be given an opportunity to see some of the work going on, and good salaries dependent on age qualifications and experience will be offered to men and women chosen to join an expanding department where there is ample scope for keen intelligence and practical commonsense The laboratories are situated at Battersea and are accessible from most parts of London and the southern suburbs, for those interested in furthering their studies, wide opportunities exist at Battersea or Chelsea Polytechnics which are only 10 minutes away Five-day week, good recreational facilities and staff pension scheme—Apply in writing to the Staff Manager, Battersea Church Road S W 11

ENGINEER, WITH ELECTRICAL OR PHYSICIST degree, required for development work on testing equipment for telecommunication cables Permanent and pensionable position at salary commensurate with experience and qualifications —Please apply, giving full particulars, to Personnel Officer, Southern United Telephone Cables, Ltd, Dagenham Dock, Essex

---

GRADUATES, WITH AND WITHOUT EXPERIENCE are invited to apply for interesting and progressive positions in the Research Laboratories of a large manufacturing organization Vacancies in the following fields are offered to suitable applicants The overall performance of communication systems of all types Centimetric research micro-wave links and associated equipment and problems Transistor development and applications Circuit development for telecommunications and television—Applications for interview should be made to Mr P J Rogers Personnel Manager, Standard Telecommunication Laboratories Limited, Progress Way, Great Cambridge Road, Enfield Middlesex

---

Advertisers please note You must add "Apply Employment Exchange" unless the employment advertised or the workers required are excepted under the Notification of Vacancies Order

FISONS PEST CONTROL, LIMITED, CAMBRIDGE, has vacancies in Chemical Division for Chemists to originate and develop new manufacturing processes for organic chemicals Initial salary range £550 to £800 per annum, according to age, qualifications and experience Permanent, progressive positions Good canteen facilities Lodging accommodation available—Write (quoting No 1004), stating age, fullest particulars and salary required, to Personnel Manager, Fisons Pest Control, Ltd, Bourn, Cambridge

GRANTS & SCHOLARSHIPS

DUBLIN INSTITUTE FOR ADVANCED STUDIES
SCHOOL OF THEORETICAL PHYSICS

The Governing Board of the School of Theoretical Physics of the Dublin Institute for Advanced Studies is prepared to award a limited number of scholarships, value £350 per annum, tenable in the school during the academic year, 1955-6

For further particulars and forms of application candidates should apply immediately to The Senior Clerk, Dublin Institute for Advanced Studies, 64 Merrion Square, Dublin Completed applications should reach the Senior Clerk on or before June 1, 1955

IMPERIAL COLLEGE
BURSARIES FOR POSTGRADUATE STUDENTS

Bursaries are available for Session 1955-56 to suitable persons for Courses of Postgraduate Study (not research) in the following subjects Civil Engineering, Mechanical Engineering, Electrical Engineering, Chemical Engineering Applicants must be graduates, who have spent at least one year away from University since graduation preferably in Industry The bursaries will be of value £300 to £400 according to circumstances

Applications should be sent to the Deputy Registrar City and Guilds College, Exhibition Road, London, S W 7, not later than April 18 1955

THE BRITISH FEDERATION OF UNIVERSITY Women announce Ida Smedley MacLean Junior British Scholarship, 1955-56 Value £100 for research or training for research Open to women graduates of the British Isles, under 30 years of age (extension for national service) Summer Research Grant Reid Hall, Paris, 1955 providing two months' residence from July 25 for a woman graduate to pursue scholarly research—Details from Research Applications B F U W Ltd, 17A Kings Road London, S W 3 Applications by April 25 1955

RAMSAY MEMORIAL FELLOWSHIPS FOR Advanced Students of Chemistry The Trustees will consider in June applications for three Ramsay Memorial Fellowships for Advanced Students of Chemistry One of the Fellowships will be limited to candidates educated in Glasgow, who can apply to be considered for either Fellowship The value of each Fellowship will be £450 per annum to which may be added a grant for expenses of research not exceeding £100 per annum The Fellowships will normally be tenable for two years—Full particulars can be obtained from the Joint Honorary Secretaries, Ramsay Memorial Fellowships Trust, University College, London, Gower Street W C 1 Completed application forms must be received not later than April 21 1955

FOR SALE AND WANTED

CORNEAL AND CONTACT LENSES EASY payments arranged if desired—For details and free booklet write David Blackstone, Ltd, Dept 235, Triumph House, 189 Regent Street, London, W 1 Tel Regent 3516-7 Consulting Rooms in Leeds, York, Leicester, Middlesbrough Newcastle etc

Australia Calls

TELECOMMUNICATION ENGINEERS

Revised Salary Scale: (In £A) Grade I Engineer £890 to £1310
Group Engineer £1394 to £1564

AUSTRALIA is developing rapidly and urgently needs professionally qualified electrical, mechanical and civil engineers to assist in the expansion and maintenance of its national telephone, telegraph, radio and television services

QUALIFICATIONS Engineers academically qualified for Membership of main Institutions of Engineers.

STARTING SALARIES: According to qualifications and experience. Graduates £932 to £1058

CONDITIONS OF APPOINTMENT · Permanent appointment to the Postmaster-General's Department Free passages for appointee and dependants Initial accommodation provided In approved circumstances, special settling-in allowances Full salary from date of embarkation Superannuation, annual and sick leave conditions Good opportunity for advancement

FOR FURTHER DETAILS Engineers qualified or about to qualify, enquire from the Australian Post Office Representative, Australia House, Strand, London, W C 2

THE FARADAY SOCIETY

A GENERAL DISCUSSION
on
MICROWAVE AND RADIO FREQUENCY SPECTROSCOPY
will be held from
April 4–6, 1955, at The University, Cambridge.

The Discussion will be divided into four main sections

I. Microwaves
II Nuclear magnetic resonance
III Paramagnetic resonance
IV Quadrupole spectroscopy.

Full particulars regarding application for accommodation and preprints may be obtained from The Faraday Society, 6, Gray's Inn Square, London, W.C 1

A GENERAL DISCUSSION
on
THE PHYSICAL CHEMISTRY OF ENZYMES
will be held from
August 10–12, 1955, at The University, Oxford

The Discussion, which is being arranged by the Colloid and Biophysics Committee of The Faraday Society, will be divided into two main topics

I Kinetics and mechanisms
II Characterisation and physical properties.

Full particulars regarding application for accommodation and preprints will be issued in due course The Faraday Society, 6, Gray's Inn Square, London, W C 1

LONG WORKING DISTANCE ATTACHMENT

. provides a working distance of 12·8 mm between object glass and specimen when fitted to a standard microscope in conjunction with a conventional 4 or 8 mm objective

A further important feature is that the use of this attachment eliminates image reversal and thus further facilitates examination and manipulation of specimens.

Triphenyl Phosphite

Triphenyl Phosphite is a chemical for which several interesting uses have been established. For example, in the manufacture of alkyd resins and other paint media, it gives products of superior colour and clarity. Another application is in the preparation of alkyl halides difficult to prepare by more orthodox methods. Triphenyl Phosphite has been suggested as an oil additive, a fireproofing agent for natural and synthetic fibres and a termite repellent. Triphenyl Phosphite, a pale straw coloured liquid, is now available in commercial quantities

Double Beam Oscillograph
Model 1049 MkII

Whilst essentially similar to the original model, the 1049 Mk II provides added reliability against high voltage breakdown by the use of a sealed, oil-filled E H.T. power transformer The instrument meets the requirements of Industry and the Research fields of Physics and Medicine by providing an oscillograph for the display and measurement of phenomena of zero or very low frequency and those where amplifier bandwidths of up to 100 Kc/s are required The oscillograph incorporates the Cossor 4" flat-screen Double Beam tube (type 89) operating at 2 Kv but provision is made for operation at 4 Kv when maximum spot brightness is required. The amplifier circuits are direct-coupled throughout and provide independent amplifying channels for the Y1 and Y2 Beams with a gain of 900 and 25 respectively from zero frequency to 100 Kc/s Input signal voltages and frequency may be measured on either channel using the calibrated dials and special anti-parallax graticule The direct-coupled Time Base is arranged to provide a repetitive or triggered scan with a time range of 1 5 seconds to 150 micro-seconds and can be synchronized fron a pulse derived either from the internal worl circuits or from an external source. A continuously variable control adjusts the amplitud of the sync. or trigger signal and selects th polarity of the pulse from which synchronizatio is desired "Z" modulation system is incorporated for time-marking purposes. Stabilization against mains variations up to 10% i provided for amplifiers and cathode ray tub supplies. Long period stability is reached withi 5-10 minutes of switching on. A pre-amplifie (Model 1434) and photographic recording equipment is available for this oscillograph

Purer than the driven snow!

Ask T B. Ford for the answer to any filtration problem, and a perfectly pure and lucid filtrate is yours Ford's are experts in filtration. They make filtration media for every type of filter—and the standard of efficiency is unsurpassed.

From Ford's, you can obtain filtration media so efficient that they can be used to remove contaminating bacteria and moulds, thus sterilizing the liquids passed through them. This thorough filtration is achieved by the careful, precise admixture of asbestos fibres and cellulose, providing a mat that retains a high degree of porosity and permits a high rate of flow. Ford's Sterimats and Claraid not only filter but adsorb any micro-organisms that would spoil an otherwise stable, immaculate, crystal-clear filtrate

Twenty years of continuous laboratory research and experiment have made T B. Ford Ltd. *the* authority on every aspect of filtration media And they make the best in the world

This laboratory service is filtration NEWS!

Ford's provide a laboratory service, staffed by a team of experts, which is available to all manufacturers, free of charge Some manufacturers, with their own fully-equipped laboratories, simply want Ford's to check and confirm their own research findings. Others call upon Ford's to solve some particular problem in their filtration process, whether directly concerned with the media itself or not. Whatever the problem, Ford's will gladly undertake the necessary laboratory research. Write to T B Ford Ltd, Laboratory Service, 101 High Holborn, London, W C 1

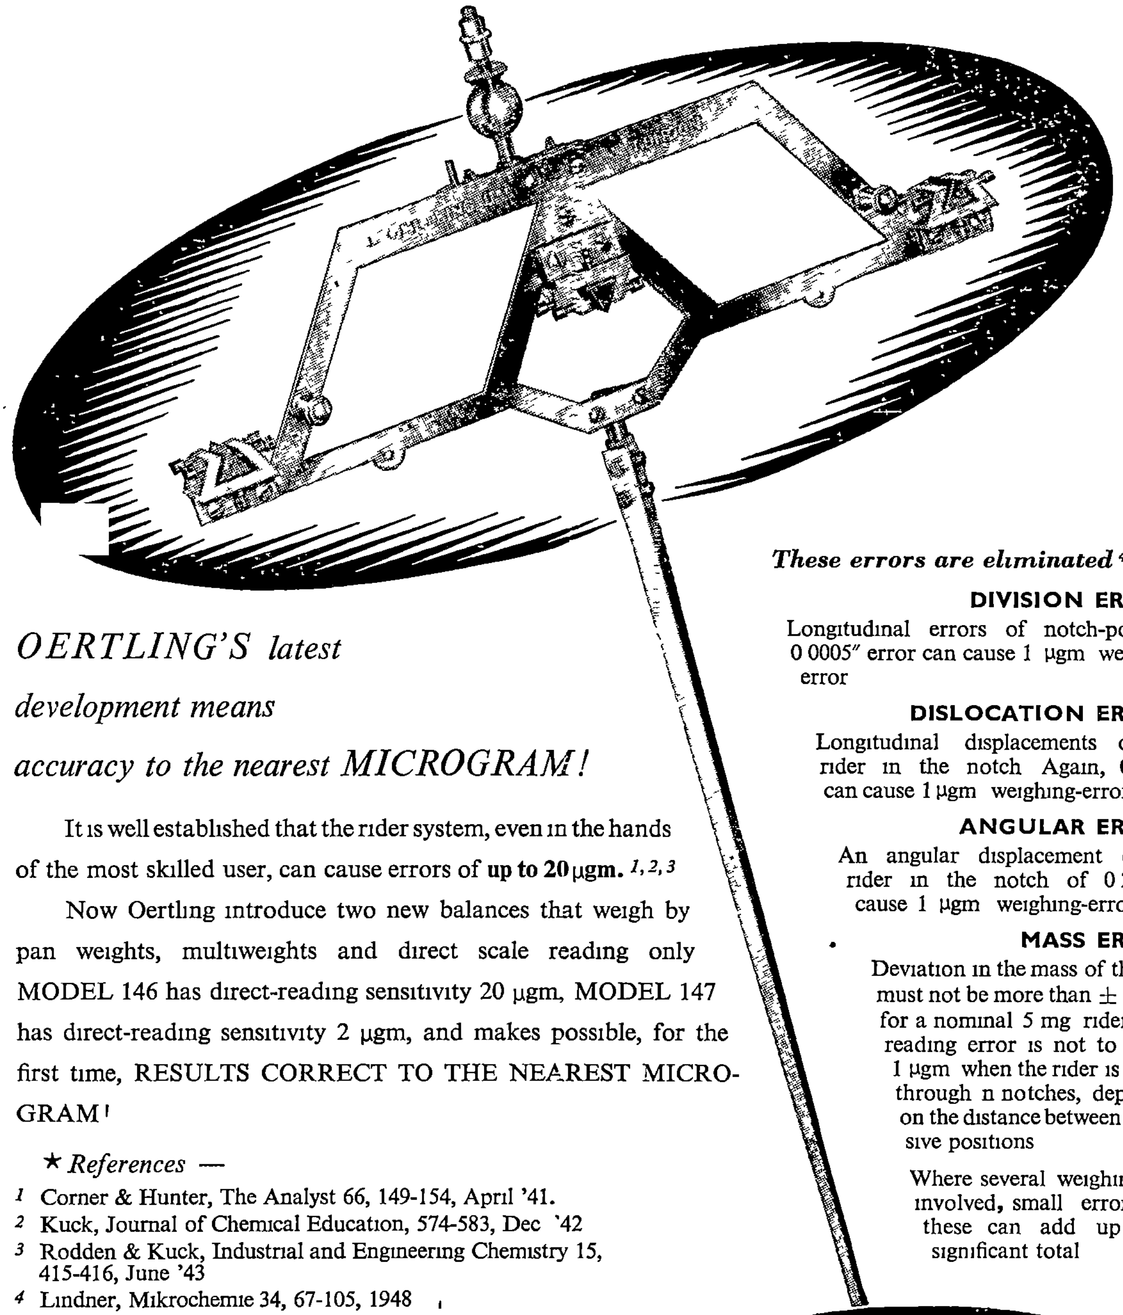
Look No Riders!



These errors are eliminated[4]

DIVISION ERRORS

Longitudinal errors of notch-position 0·0005″ error can cause 1 μgm weighing-error

DISLOCATION ERRORS

Longitudinal displacements of the rider in the notch Again, 0·0005″ can cause 1 μgm weighing-error

ANGULAR ERRORS

An angular displacement of the rider in the notch of 0·2° can cause 1 μgm weighing-error

MASS ERRORS

Deviation in the mass of the rider must not be more than $\pm \frac{50}{n}$ μgm for a nominal 5 mg rider if the reading error is not to exceed 1 μgm when the rider is moved through n notches, depending on the distance between successive positions

Where several weighings are involved, small errors like these can add up to a significant total

OERTLING'S latest development means accuracy to the nearest MICROGRAM!

It is well established that the rider system, even in the hands of the most skilled user, can cause errors of **up to 20 μgm.** [1,2,3]

Now Oertling introduce two new balances that weigh by pan weights, multiweights and direct scale reading only MODEL 146 has direct-reading sensitivity 20 μgm, MODEL 147 has direct-reading sensitivity 2 μgm, and makes possible, for the first time, RESULTS CORRECT TO THE NEAREST MICROGRAM!

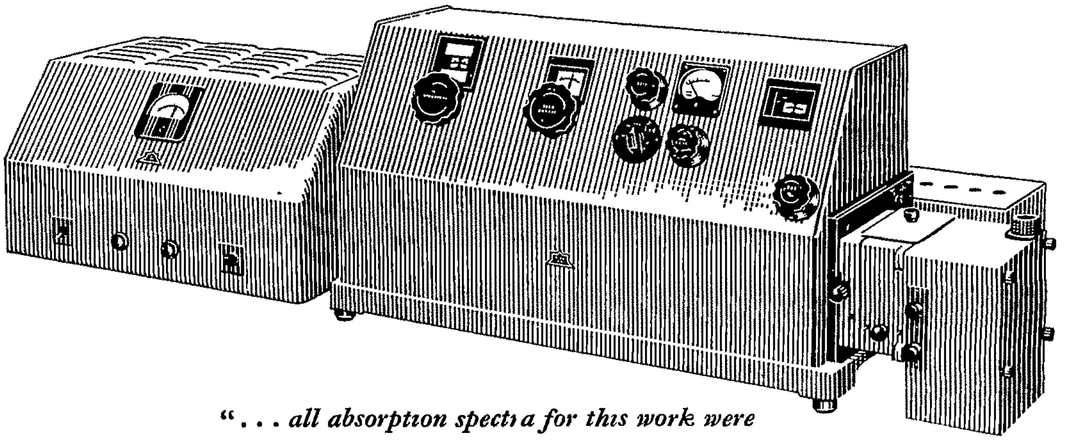
RELIABLE IN ALL WORKING CONDITIONS

"... the most convenient method was found to be ultraviolet absorption measurement ..."



*"... all absorption spectra for this work were measured with a Unicam Quartz Spectrophotometer model SP.*500 ..."

The frequency with which the Unicam SP.500 is mentioned in the literature is convincing proof of the sustained quality of its performance and of the wide variety of applications for which it is particularly suitable. For the maintenance of standards of both raw materials and the final product, for academic and medical research, wherever there is a problem of analysis or control, the easiest, most efficient, most economical answer may well be the Unicam SP.500 Spectrophotometer.

An illustrated leaflet describing the instrument in detail will gladly be sent on request.

SCIENTIFIC PROGRESS AND SECURITY REGULATIONS

IN a recent address on "The Social Responsibility of Scientists" at the annual general meeting of the American Philosophical Society, Dr. J H. Hildebrand strongly criticized the views expressed by Prof Lewis Mumford in his paper in November 1953 on anticipations and social consequences of atomic energy Dr. Hildebrand challenged Prof Mumford's assumption that scientists have been indifferent to the social consequences of their work, and, in particular, the implication that a scientist could foresee the possible misuse of a particular discovery and refrain from making it. A scientist, he pointed out, can seldom predict just what he will discover, least of all its possible misuse in the hands of evil men Many of the most valuable discoveries have been made by chance while in search of something else, and, so far as nuclear energy is concerned, even when Chadwick discovered the neutron in 1932 there was no reason for believing that nuclei could be made to explode, and the bare possibility of releasing energy for useful purposes must have seemed a reasonable enterprise to any reasonable person The possibility of a catastrophic release of nuclear energy was revealed only in 1938 when Hahn and Meitner were searching for an artificial trans-uranium element

It is almost impossible to say, even with the aid of hindsight, at what stage this train of developments should have been stopped It might well have involved denying Norman Lockyer the use of the spectroscope with which, in 1868, he discovered helium in the sun Dr. Hildebrand argues, therefore, that it is practically impossible for the scientist to predict the moral consequences of his choice of a problem, however much he may wish to do so Not even the wisest man living can foresee all the future effects of a new fundamental discovery and correctly balance the good against the ill consequences. Apart from this, a moratorium on science could only be made effective through a moratorium on scientists. To be effective, it would have to be world-wide and would thus encounter the same difficulty as attempts at disarmament and political co-operation generally.

Dr. Hildebrand sees no hope of progress along such lines. It is neither practical nor sensible, and he agrees with Dr J Bronowski that there are no panaceas, and that the cure of the evil is to be found in a fuller understanding of both science and society Nor does he believe that either a world congress of scientists or a great assize of scientific knowledge, such as Prof Lewis Mumford suggests, would have any value He has no belief in the special competence of scientists outside their own field, and the facts are already clear enough The real problem is to get people to face the facts squarely and sensibly It is a problem in human relations, regarding which physical scientists are not particularly expert

It is also, Dr. Hildebrand adds, a matter of recognizing that, as Reinhold Niebuhr said, "there are solutions, there is no solution". Because of that, it is a problem in communication as well as in human relations, and while Dr. Hildebrand suggests that we are in error in regarding atomic bombs as the chief danger, he suggests also that the real danger is that so few of those leaving school possess both knowledge and desire for any serious intellectual pursuit. That, he submits, is the real problem, and not any alleged defect of "the scientific mind", the existence of which, like Prof A V. Hill, he denies.

Dr Hildebrand endorses Prof A V Hill's view of the social responsibility of scientists, with its humble refusal to claim any special authority or knowledge as citizens outside their professional competence, and its recognition of the common obligations of honesty, kindness, courage and tolerance It is in the light of this outlook that Dr Hildebrand's assertion that the free world will not be saved by science alone, although it would not be saved without science, should be judged We shall need, he added, every resource of knowledge and intelligence in order to remain free, and afterwards, when addressing the American Association for the Advancement of Science, he placed this insistence on the importance of a long educational process by scientists in order to dispel public misconceptions about them and the way they work, more specifically in the context of security.

Scientists have not been too successful in making themselves and their work understood by the public, and it is because of this that, as Dr Hildebrand pointed out, one of the many needs of to-day is to make it clearly understood that there are no long-term secrets in science Like Prof H. S. Commager and Prof W Gellhorn, Dr Hildebrand insists that positive achievement and progress, not the negative policy of restriction and security, provide the only firm basis of security. Once the implications of security are clearly understood, there is little risk that public support will be forthcoming for any policy which, by endangering the freedom of investigation, discussion and communication in science, endangers also the free world itself

As Dr Vannevar Bush insisted at the same meeting, in seeking to end the present distrust, scientists are not seeking special privilege, indeed, the statement issued last December by the American Association for the Advancement of Science, while criticizing existing procedures on loyalty and security in the United States, contains proposals for strengthening the basis of national security which are of much wider interest They are at least as pertinent in Great Britain as in the United States, and it should be noted that the Association has since urged the adoption of a uniform policy by all government agencies making grants for, or otherwise supporting, unclassified research. The Association is concerned about the procedures under which scientists are judged worthy of receiving federal grants for research which does not involve problems of national security, and it recommends specifically the general adoption of the policy by which the National Science Foundation determines its awards. Under that policy, appraisal of the merit of a proposal is based on the experience, competence and integrity of the investigator, as judged by a panel of competent scientists who have a working knowledge of his qualifications The Foundation does not, however, knowingly make or continue grants to a person who is an avowed Communist, or has been established as such through judicial proceedings, or to anyone who avowedly advocates change in the government of the United States other than by constitutional means, or who has been convicted of sabotage, espionage or similar crime involving national security.

The statement issued by the American Association for the Advancement of Science gives a constructive analysis of the policies on which the security-screening programme of the United States is based. It accepts frankly both the necessity for such a programme at the present time, and also that examination of the character of persons likely to be entrusted with vital information must go beyond a determination of loyalty. It was that second point which provoked the sharpest discussion in the debates last year on the Atomic Energy Authority Bill in Great Britain. A person may be of unquestioned loyalty and still be a risk if he is given access to vital information. The statement also points out that the security programme is for the protection of the whole nation and that, although scientists may be specially interested, because of the intimate dependence of military strength upon scientific progress, the welfare of the nation as a whole must be the controlling factor, and not the interests of an individual or the welfare of a particular group. The policies, moreover, must be comprehensive and their application impartial.

The statement, however, derives much of its general interest from its more extended discussion of a further point which has received much less attention and the implications of which require wider consideration they should not have been overlooked in the recent discussions of the Commonwealth Prime Ministers on atomic and thermonuclear energy. Security-screening programmes are a means to an end, not an end in themselves. Their role in defence policy is negative rather than positive They may deprive a potential enemy, at any rate temporarily, of information about armed forces or the development of new weapons, but they create no new weapons themselves The degree of secrecy, the conditions under which secrecy is desirable, and the risk of losing secrecy have all to be considered in terms of their contribution to the development and maintenance of the military, industrial and moral strength which are a nation's ultimate protection against effective attack.

What has now to be recognized is that, with the essential dependence to-day of military strength upon science, the security practices used in the past to safeguard military information are no longer fully valid. Scientific knowledge cannot be kept secret by such means Progress in science is a cumulative process in which each scientist builds upon what is known, and national boundaries and security systems cannot contain this process of extending knowledge without so discouraging the spirit of inquiry that the state of learning and of technology as well as the rate of scientific progress are adversely affected. At best, among advanced nations, security measures can provide an advantage of time there is no such thing as a permanent scientific secret.

When this is recognized, the American Association for the Advancement of Science points out, the whole picture changes. Since security demands superiority in science, the first consideration for security is to provide the most favourable circumstances for the advancement of science—an environment that will foster a healthier, more imaginative and more energetic development than that which serves enemies of freedom. The Association does not fail to recognize that there is a proper part for secrecy to play, but, by boldly challenging the current negative conception of security, it directs attention to the important but neglected questions which have to be asked if a positive programme of national security is to be developed, while keeping ahead of potential enemies in fundamental knowledge and in its application

Such a programme would ask first how best national progress can be assisted rather than how the danger of leaks can be avoided, and would be more concerned to make the most of our advantages than to minimize losses Where it becomes necessary to ask what security risk is incurred in employing a particular person, the no less vital questions of risk of delayed progress or diminished achievement incurred in not employing him must also be considered In practice, little consideration has been given to the potential gains that may accrue if the risk is taken.

So far as the United States is concerned, Dr E. U. Condon's recent decision to abandon his fight for security clearance because he feels there is no possibility of securing a fair and independent judgment at the present time, affords strong support for the Association's view. In announcing his decision and his resignation as director of research of the Corning Glass Works, Dr. Condon said that the long-drawn-out clearance difficulties had begun to affect his ability to perform his duties efficiently and even to impair his health. The case is worth noting as an example of the strained relations between the Government and scientists in the United States, and of the demoralizing effects on the scientific community over which Dr Vannevar Bush and others have expressed their concern.

Two specific changes are proposed by the American Association for the Advancement of Science First, it suggests that greater weight should be given to a man's potential contributions In any given position, greater risks can clearly be afforded if there is a large potential gain rather than only a small one. It is admitted that there would be difficulties in determining and weighing the positive factors to be considered, but the Association suggests that scientists would welcome the opportunity of co-operating in developing appropriate standards and decisions. Less difficulty, however, is attached to the second proposal, namely, that the risk should be measured with more regard to the nature of the work to be done No satisfactory procedure has yet been advanced, it is pointed out, for screening persons engaged in unclassified research by standards appropriate for screening those who have access to details of war plans or advanced weapons. But in unclassified research, the primary question is loyalty, and while neither public opinion nor the opinion of scientists would be likely to endorse the supply of public funds to a scientist of demonstrated disloyalty, that is a different matter from a security risk. Stringent security precautions are appropriate only when the information to be guarded justifies the stringency.

Adoption of these two suggestions consorts with the encouragement of free interchange of ideas and information, on which fundamental research thrives, and the Association's statement points out how such free discussion contributes to advance in technology both for peaceful and for military purposes. The positive policy advocated would encourage the interchange of scientific information and would endeavour to use as much high ability as possible, even if not all such ability could be safely used in the more sensitive positions. The Association points to the uncounted costs of the negative policy hitherto pursued, and claims that a positive policy, while admittedly demanding boldness, would eliminate such losses and foster the development and effective use of the resources of knowledge, talent and enthusiasm which the United States and the free world possess It would also go far to re-establish confidence between the Government and scientists and technologists, and remove the existing distrust and frustration which present procedures engender.

GALVANI AND THE DISCOVERY OF 'ANIMAL ELECTRICITY'

Commentary on the Effects of Electricity on Muscular Motion

By Luigi Galvani. Translated into English by Margaret Glover Foley, with notes and a critical introduction by I Bernard Cohen, together with a facsimile of Galvani's *De Viribus Electricitatis in Motu Musculari Commentarius* (1791), and a Bibliography of the editions and translations of Galvani's book, prepared by John Farquhar Fulton and Madeline E. Stanton Pp. 176. (Norwalk, Conn. Burndy Library, 1953) n p.

GALVANI's small work on electricity and motion is one of those books which have acted as stimuli to later thought in many fields, but the contents of which are little or imperfectly known to-day. The fact that Galvani carried out experiments by which electrical stimulation caused the contraction of the severed legs of a frog will be remembered by most—though incidentally even this fact is not mentioned in some of the histories of medicine. But this simplification overlooks two fundamental points. The direct stimulation of muscles by electricity had already been widely practised, and Galvani's fundamental observation was not the result of direct stimulation.

Sir Isaac Newton had suggested as early as 1713 that an 'electric spirit' might be the cause of both sensation and of muscular motion. Caldani, who was Galvani's predecessor at Bologna, and Laghi were both experimenting on the electrical stimulation of muscles before 1760, and Albrecht von Haller was also familiar with the practice. The point at issue at this period was whether the 'animal spirits', which in the old physiology were supposed to flow in the nerves to produce sensation or muscular contraction, were indeed 'animal electricity', produced in the living body itself. In 1773, John Hunter dissected the torpedo, or stinging-ray, and an excellent account of its electric properties was published as a complementary paper by John Walsh in the same number of the *Philosophical Transactions*. By 1780 it was generally held that living muscle produced an electric charge which was discharged through the nerves. But there was no proof that this 'animal electricity' actually existed. It was about this time that Galvani started his investigations on frogs' legs. The legend says that he noticed a certain phenomenon while he was preparing frogs' legs in the kitchen for his sick wife There is no foundation for this statement, but his first observation was nevertheless, as he says himself, the result of an accident.

Galvani's initial observation was made when he was preparing the hind legs of a frog for experimental work—possibly the direct stimulation of the nerve or the muscle by electricity. What happened then is reminiscent of Roentgen's 'accidental' discovery of X-rays This is what Galvani says. "Having in mind other things, I placed the frog on the same table as an electrical machine . . . so that the animal was completely separated from and removed at a considerable distance from the machine's conductor. When one of my assistants by chance lightly applied the point of a scalpel to the inner crural nerves of the frog, suddenly all the muscles of the limbs were seen so to contract that they appeared to have fallen into violent tonic convulsions Another assistant who was present when we were performing electrical experiments thought he observed that this phenomenon occurred when a spark was discharged from the conductor of the electrical machine". Galvani repeated the experiment and carried out many others under varying conditions which need not be summarized. His conclusion was that the 'animal electricity' which is peculiar to animals is secreted mostly by the brain, and is conducted specially by the nerves A discharge of electricity from the muscle by way of the nerve stimulates the muscle fibres and results in a contraction

We would now explain the first experiment by the assumption of electrostatic induction, and on many other points Galvani was wrong. His experiments must have been spread over a long time, and it was not until 1791 that he published his "De viribus electricitatis" as an *opusculum* of fifty-five pages in the transactions of the Bologna Academy. At least one copy exists of a direct reprint of the *opusculum*, and later in 1791 there was a further reprint in which the first signature was reset. Galvani sent an inscribed copy of this rare reprint to his younger contemporary, Alessandro Volta, who in 1791 was a very distinguished scientist famous for his work on the electrophorus, on electrometers, and on atmospheric electricity. At first Volta apparently thought that Galvani had shown the existence of animal electricity, since he said in an address at Paris on May 5, 1792, that Galvani's book "contains one of those great and brilliant discoveries which deserves to mark a new era in the annals of physics and medicine". However, Galvani's somewhat unscientific approach to the subject could not long satisfy Volta, who soon experimented on his own account During this year 1792 Volta published twelve papers on galvanism In the subsequent controversy, Galvani, a modest retiring man, remained silent, and the defence of 'animal electricity' was conducted by his nephew Aldini Volta very soon became convinced that Galvani's results were due to the contact between a metal and a moist body, and the experiments based on this theory led to his discovery of the voltaic pile, the chain of cups, and the continuous current From his physiological experiments he deduced that the electrical stimulation of any nerve produces the type of action or sensation with which the nerve is normally associated. The direct sequel to this discovery was the doctrine of specific nerve energy developed by Johannes Muller.

Galvani died in 1798, and in his last years he did little to support his adherents in the battle for the cause of 'animal electricity'. Volta survived him by twenty-nine years, and his theories held the field then and long after his death It is true that in 1811 Leopoldo Nobili, using the newly invented galvanometer, detected electric currents in frogs' muscles But Nobili attributed these currents to a thermo-electric effect, and the existence of an electric current was not recognized until the publication of the work of Matteucci in 1838 This was the 'current of injury' which was investigated more fully by DuBois-Reymond

This fine facsimile edition of the Latin text of Galvani's work is due to the enthusiasm and munificence of Mr. Bern Dibner founder of the Burndy Library Galvani's Latin is not easy reading, and the accompanying English translation by Dr Foley is lively and idiomatic It is not a literal translation, but a comparison of certain passages with the original shows that it preserves the sense with accuracy. It is curious that while Galvani's book was translated into German in 1793 and again in 1794, into Italian and Russian in 1937, into French in 1939, a translation into English was not published until 1953. In that year another English translation by Prof Robert Montraville Green also appeared The present edition is enriched by a very learned and well-written introduction by Dr. I. Bernard Cohen, in which he discusses critically the state of electrical knowledge before and during the time of Galvani The work concludes with a valuable bibliography of Galvani's book by Prof John F Fulton and Miss Madeline Stanton. This is a revision of the bibliography originally published in 1936 by Prof. Fulton and Harvey Cushing E ASHWORTH UNDERWOOD

ADRIATIC CYSTOCEIRAS

Jadranske cistozire

Njihova morfologija, ekologija i razvitak By Dr. Ante Ercegović (Fauna i Flora Jadrana—Knjiga 2) Pp v+212+30 plates. (Split Institut za Oceanografiju i Ribarstvo Fnr Jugoslavije, 1952) n.p

ALTHOUGH the translucent inshore waters of the eastern Adriatic and its numerous green islets are very rich in *Cystoceira*, these plants have hitherto not been the subject of a serious systematic study, comparable with that of Valiante in the Gulf of Naples and Sauvageau at Banyuls The recent work by Ercegović is therefore of especial importance both for itself and from a comparative point of view Thoug the book is written in Croat with a description of th new species in Latin, there is a French summar (36 pp), and a French translation of the rubri of the statistical tables is given throughout th volume

A general morphological description of the genu *Cystoceira* is followed by a key to fifteen specie seven of which are described for the first time It i interesting to note that though the genus is generall considered to be hermaphrodite, unisexual individua have been recorded. A systematic account is give of each of the species mentioned in the key, and th species, together with their sub-species, are beaut fully illustrated by plates which show the essenti criteria of determination as well as the habit. Th statistical tables record the precise location of th plants, the date of collecting, depth, fertility an type This part of the work is of especial valu because its precision will enable later studies to correlated with those now published, a matter th may well prove important in a genus with such a exceptionally wide range of variability as *Cystoceir*

The second part of the book deals with th ecological study of the genus and raises many point of interest The Fucales is an order with a very wid geographical range, its main centre occurring perhap in the waters of the southern hemisphere, though i the North Atlantic its members are an importan constituent of the inshore marine flora Betwee these geographical extremes, the genus *Cystoceir* occurs in considerable quantity in the Mediterranea and Adriatic, and Ercegović points out that th genus appears to be in a state of instability He examines the great variability in the species from thre points of view dependence on external environmenta factors, adaptational value and importance in th evolution of new forms Great care has been take to study the first of these in relation to six species in all of which a study has been made of the rang of form of different populations and also the variability within a population.

In considering the possible adaptational value o the variation, Ercegović discusses first the effect o the substratum and the effect of variation in wate temperature. This latter is of great importance i the Adriatic, which has a considerable temperature range within a comparatively small area. An inte esting correlation is made between the growth an reproductive periods of the various species and wate temperature

Light intensity is discussed in relation to specie distribution, as is also the effect of water movement oxygenation and salinity.

The third part of the ecological section deals wit the instability of the genus in the Adriatic and th evolution of new forms Consideration is given t genetical variation, selection and ultimate isolation The author concludes from his extensive study tha *Cystoceira* is a genus of comparatively recent origin not yet completely stabilized and thus still capabl potentially of further evolution.

The size and location of the Adriatic make it a eminently suitable place for an ecological an evolutionary study of *Cystoceira*, and it is hoped tha this monograph will form the basis for further wor in the future, particularly along cytological an genetical lines. Though the collection of the plant is not facilitated by long periods of low-water as i the Atlantic, the beauty of the coast with its gree islands and crystal-clear inshore water compensate the algologist until the light fades. Then, on a clear, still night, each star sheds its 'road to the Isles' and the lights from the little sailing vessels mark the homeward journey of those islanders who have sold fruit and olive oil on the mainland quays during the day. Under such conditions can *Cystoceira* be studied in one of its most rewarding localities

LILY NEWTON

DISLOCATION THEORY

Dislocations in Crystals

By W. T. Read, Jr (International Series in Pure and Applied Physics) Pp xvii+228. (London McGraw-Hill Publishing Company, Ltd., 1953) 36*s*.

THIS book has the well-defined object of setting down the strict logic of dislocation theory, and of deriving its consequences in some special physical situations where the dislocation structure is uniquely defined by the macroscopic conditions or by direct observation. The reader the author has in mind throughout is one who is willing to make an effort to teach himself, only a modest mathematical ability is required to follow the text and many of the numerous illustrative problems.

The first four chapters introduce the geometrical properties of single dislocations, their slip and climb movements, the concepts of stacking faults, partial dislocations and 'good' and 'bad' crystals Chapter 5 gives the details of the forces on dislocations under uniform stress and is rather more mathematical. Chapters 6 and 7 are again geometrical and deal with dislocation multiplication mechanisms and the details of partial and extended dislocations in real lattices. Chapters 8 and 9 contain the mathematics of the stresses around dislocations and the forces of interaction between them, and conclude the first part of the book. The remaining five chapters deal with the application of the theory to two physical problems—crystal growth and the properties of grain boundaries In the chapters dealing with the energy and mobility of boundaries a strongly critical approach is used, so that after a careful reading and study of the problems, the reader is left with an unusually clear picture of what is required by theory, and what is merely plausible

The book is in no way concerned to introduce the reader to the whole scope of dislocation theory, and scarcely mentions such topics as the critical shear stress of single crystals, the yield-point phenomena or theories of work-hardening, recovery and polygonization. While the omission of these topics is in keeping with the policy of avoiding discussion of situations where the precise arrangement of the dislocations is unknown and important, it means that a reader wishing to master the interpretational side of dislocation theory must supplement Read's book with some other, such as Cottrell's "Dislocations and Plastic Flow in Crystals" (Oxford University Press)

There must, however, be many people concerned with plastic deformation of crystals, and having some familiarity with dislocations who feel a need for a firmer logical and mathematical basis for their knowledge This book, with its seventy or more problems and hundred references, should prove ideal for anyone prepared to read carefully and work constructively Some of the problems make more demands on the reader's mathematics than does the main text. and a few sound rather like young research programmes. They all make the reader think.

The standard of production is the usual high one expected of the McGraw-Hill monographs The text is lucid and illustrated by many well thought out diagrams The paragraph headings in the detailed contents lists are likely to prove as useful for reference purposes as is the index, though the latter is pleasantly explicit. The limited public to whom the book is addressed should be well pleased with it, those who want a general account of physical hypotheses, however successful and widely accepted they may be, must look elsewhere.

W M LOMER

TEXT-BOOK OF APPLIED ELASTICITY

Applied Elasticity

By Prof Chi-Teh Wang Pp. ix+357 (London McGraw-Hill Publishing Company, Ltd, 1953) 57*s* 6*d*

THIS book is written for "senior-graduate engineering students", it is an advanced text-book rather than a mathematical treatise on elasticity In it the author explains fundamental elasticity theory in fairly simple terms and then deals with several of the most useful analytical and numerical methods of solving problems.

The first two chapters are concise and deal with the analysis of stress and strain, all equations being given in component form in the manner of Timoshenko. Chapter 3 is concerned with stress–strain relations, and the theory is limited to that of isotropic solids; also included are short sections on strain energy, existence and uniqueness of solutions and St. Venant's principle Plane-stress and plane-strain problems, in both rectangular and polar co-ordinates, are dealt with in Chapter 4, this includes solutions for rotating disks and problems of thermal stress. Chapter 5 is devoted to torsion of prismatic bars, thin open sections, thin-walled tubes and circular shafts of variable diameter. An excellent chapter is devoted to finite difference approximations and the relaxation technique

The principles of potential and complementary energy are introduced in Chapter 7 together with a discussion in terms of the variational calculus Also included in this chapter are the Rayleigh–Ritz method, the so-called Galerkin method, the method of Biezeno and Koch, and finally the reciprocal theorem and Castigliano's theorems This is followed by a chapter on solution by means of complex variables.

The remainder of the book is concerned with problems of "Advanced Strength of Materials". It comprises four chapters which deal respectively with the bending and compression of bars and elastic stability, numerical methods for finding critical loads, the bending and buckling of thin plates, and thin shells

When the purpose of the book is borne in mind—namely, the instruction of engineers—it is apparent that the author has selected the topics of his discussion with considerable skill. For little is included that is of interest only to the mathematician. The presentation is lucid, and problems are included for the reader who wishes to test his understanding of the theory

R E D BISHOP

Diamond Technology

Production Methods for Diamond and Gem Stones. By Paul Grodzinski. Second revised and enlarged edition. Pp. xxxiv+784. (London: N.A.G. Press, Ltd., 1953.) 52s. 6d.

"DIAMOND Technology" is a completely revised and enlarged edition of Mr. P. Grodzinski's "Diamond and Gemstone Production Methods", which was published as a matter of urgent necessity soon after the start of the Second World War. The earlier volume contained 256 pages, whereas the new edition has 784—an indication of the vast increase during the past decade in the use and importance of diamond in a number of industrial processes. It is indeed fortunate for those concerned with diamond mining that, unlike the non-transparent types of other gem minerals, even impure diamonds have a considerable market value.

In his capacity as technical editor of the *Industrial Diamond Review*, Mr. Grodzinski has been in constant touch with technical advances throughout the world, and has himself contributed towards the design of new instruments, particularly in the field of hardness testing. The book is divided into two main sections, the first dealing with general manufacturing methods and the second with special methods. Thus, in the first part there is a chapter on grinding and polishing gemstones, while in the second there is a parallel chapter on polishing gemstones for jewellery, where the specific forms developed are dealt with. This is bound to lead to a certain amount of overlapping, and it is possible that by careful rearrangement the book might be reduced in size without losing anything of real value. It seems to me that an opening chapter on diamond itself, its structure, crystallography, varieties and properties, would be a useful foundation for what follows. The information given in Chapter 13, on the selection and orientation of industrial diamonds, could largely be included in such a preliminary chapter.

"Diamond Technology" is a well-produced volume, and the understanding of the text is greatly assisted by the illustrations, of which there are nearly five hundred. The industrial world should be grateful to the author and publishers for bringing together so much scattered information within the covers of a book which, by modern standards, is not unduly expensive.
B. W. ANDERSON

Der Ultraschall

Und seine Anwendung in Wissenschaft und Technik. Von Dr. Ludwig Bergmann. Sechste völlig überarbeitete und erweiterte Auflage, mit 609 Bildern. Pp. xvi+1114. (Stuttgart: S. Hirzel Verlag, 1954.) Ganzleinen, 72 D. marks.

THE appearance of a sixth edition of this well-known book is a pointer both to the expansion which ultrasonics has undergone in the past years and the success of Dr. L. Bergmann in writing on the subject. He has indeed made it his life's work to keep this treatise up to date, and workers in this field will hope that he may long live to continue it.

The first edition appeared in 1937, a slim volume of some two hundred and fifty pages and a hundred and fifty figures. Now Dr. Bergmann's offspring has grown to an unwieldy tome of eleven hundred pages and six hundred figures, while the references number more than five thousand. Since practically every reference finds its due position in the text, one cannot but marvel at the industry of the author in reading and collating all this material. It is impossible to summarize the work here, but one notes, beside the more academic aspects of ultrasonics whic occupy five chapters, others on industrial applications, medical applications and ultrasonics i Nature. No worker in ultrasonics can afford to b without this book. It is a pity that the great size o this edition makes it unlikely that a publisher will b found to translate it into English as the first editio was.
E. G. RICHARDSON

Textile Fibers, Yarns, and Fabrics

A Comparative Survey of their Behavior wit Special Reference to Wool. By Ernest R. Kaswel Pp. xvi+552. (New York: Reinhold Publishin Corporation; London: Chapman and Hall, Ltd 1953.) 88s. net.

THIS book is a very full review of the literatur of those properties of fibres, yarns and fabric which depend on fibre mechanics and the geometr of yarns and cloths. The first three chapters give comprehensive description of the mechanical prope ties of the various natural and man-made fibre Succeeding chapters discuss the friction of fibres an yarns, the moisture absorption of fibres and the effe upon fibres of heat, sunlight, weather and the commo chemical reagents. Two rather flimsy chapters o the microbiological resistance of fibres and the dyeing properties conclude this part.

The second and more valuable part of the boo deals with the properties of textile structures. Fabr resilience, drape and crease recovery are ably di cussed. The chapter on resistance to abrasion especially good, though surprisingly there is n mention of 'pilling'. A single chapter on felting an shrinkage is scarcely sufficient, but the sections on t effect on wool felting of fabric geometry and blendin with other fibres are valuable. There are usef chapters on the transmission of air, heat and moistu through cloths and on the acquisition of soil by fabr and its removal.

The author quotes at length from original paper of which more than four hundred, chiefly from Briti and American journals, are listed in the bibliograph The book is well indexed and will be welcomed b textile scientists and technologists as a compendiu of research upon the functional characteristics fibres and fabrics.
W. J. ONIONS

Annual Review of Physical Chemistry, Vol. 4

G. K. Rollefson (Editor), R. E. Powell (Associa Editor). Pp. x+493. (Stanford, Calif.: Annu Reviews, Inc., 1953.) 6 dollars.

THE present volume of this excellent revie covers twenty branches of physical chemistr written by British, Canadian and American specialist All the articles are readable and informative, and t bibliographies are international in character. Th section on micro-waves and nuclear resonance giv up-to-date information on this new field; that o experimental molecular structures will be of intere to many chemists, when read in conjunction wi that on experimental crystallography.

Although these parts of the volume have be singled out for mention, all the articles are goo and the authors have contrived to make the boo read more like a text-book than an abstract journ which is a considerable achievement when the lar amount of information contained in it is taken in account. There can be no doubt that this publicatio now in its fourth year, is filling a place in chemic literature with marked success.

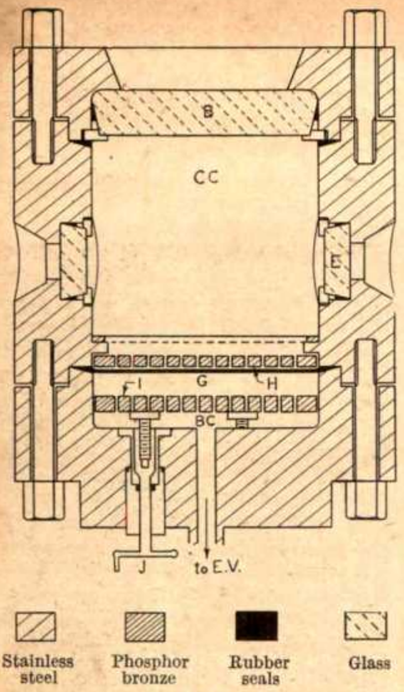

Fig. 2

their generosity in providing, without charge, electric power for the operation of the cloud chamber. We are also indebted to the construction firm of T.O.R.N.O. for assistance in the installation of the cloud chamber.

The High-pressure Cloud Chamber and its Operation

A detailed description of the cloud chamber will be published elsewhere ; but the main features of the design are illustrated in Fig. 2. The body of the chamber was constructed of stainless steel by Messrs. Brown, Bayley and Co., of Sheffield. The internal diameter is 8 in., the walls are 2¼ in. thick, and the volume of the main part *CC* of the chamber is 6 litres. The depth of the chamber is 8 in. The window *B* is of prestressed glass 1½ in. thick and the events are photographed through an aperture 3¾ in. in diameter. The illumination is provided through two similar glass windows *E*, 1⅝ in. in diameter and 1 in. thick, by Mullard *LSD*-7 photoflash tubes.

The expansion is provided by a rubber diaphragm *G* which operates between the brass plates *H*, *I*, each perforated by 600 regularly spaced holes 1/24 in. in diameter. Adjustment of the expansion ratio from outside the chamber is provided by the handle *J*, which gives a smooth axial motion to the back plate.

Initially, gas is pumped into the back chamber *BC* in sufficient quantity to force the rubber diaphragm *G* against the perforated plate *H*. Operation of the chamber is achieved by a sudden expansion of the gas in the back chamber *BC* into a third volume. This causes *G* to be pushed back suddenly against the back plate *I*.

Typical pressures in atmospheres, in the cloud chamber proper, *CC*, and the back chamber, *BC*, are listed in Table 1.

Table 1

	Cloud chamber *CC*	Back chamber *BC*
Before expansion	78	80
After expansion	73	60

The camera contains two Dallmeyer lenses of focal length 35 mm. and operates with a stereoscopic angle of 15°. An aperture $f/11$ has been used and the depth of focus is then approximately 5 cm.

Some characteristics of the operation of the chamber are set out in Table 2.

Table 2

Expansion ratio (75 atmospheres argon, alcohol)	1·06–1·07
Clearing field	2,000–4,000 V. across chamber
Recycling time	15 min.
Expansion time	0·2 sec.
Time of drop growth	0·2 sec.
Width of minimum ionization track	0·5 mm.
Sensitive time	2 sec.

The counter system used for selecting events consists of three trays of counters, one above the chamber and two below. A block of lead 15 cm. thick is placed above the top tray, and another block 5 cm. thick between the second and third trays. In a typical selection system, six-fold coincidences are required to produce an expansion of the chamber in which one counter of the top tray is discharged, any three of nine counters in the middle tray and any two of ten in the bottom tray. With such an arrangement the waiting period for an expansion is about fifteen minutes.

Interpretation of Events in High-pressure Cloud Chamber Photographs

The problem of particle identification in the high-pressure cloud chamber presents some novel features. Many of the slower particles stop in the chamber and their residual range provides an important means of identification. For example, the energies of particles just stopped in crossing one diameter of the chamber filled to a pressure of 75 atmospheres is 4·5 MeV. for electrons, 18 MeV. for μ-mesons, 20 MeV. for π-mesons, 35 MeV. for *K* mesons and 44 MeV. for protons.

Even minimum ionization tracks are continuous, and so drop-counting methods are inapplicable ; but instead, track-width measurements may be used for velocity determinations. Some information about the velocity can also be obtained from a count of the frequency of delta-rays along a track.

No magnetic field is available with the present chamber, and the only means of determining momentum is from multiple scattering. Owing to the width of the tracks, this limits the measurements to tracks for which $p\beta$ is less than 200 MeV./c. Another high-pressure cloud chamber is being built at present which will incorporate a magnetic field of 10,000 gauss. It is difficult to devise objective tests of the absence of distortion in tracks that show appreciable multiple scattering. This is being overcome to some extent by taking two sets of pictures of each event at different times after the expansion. In the measurement of events described below, it has been assumed that distortion is absent.

Results of the Operation of the Chamber

So far, three thousand photographs have been obtained during the period of operation at Marmolada. An analysis of events of interest among these shows the following.

(1) Eight V^0 particles originating in the chamber wall or in the lead around the chamber. Two of these occur in the same shower (Fig. 3) and are discussed in detail below. Four of these events are consistent with Λ^0 decays with measured *Q* values of 43^{+33}_{-13},

THE HIGH-PRESSURE CLOUD-CHAMBER COSMIC-RAY PROGRAMME AT LA MARMOLADA

By a Joint Group from University College, London, and the University of Edinburgh*

TWO widely different techniques are commonly employed in the study of the new unstable particles of the cosmic radiation: the photographic emulsion and the conventional cloud chamber operating at about atmospheric pressure. It is not always easy, however, to correlate the results of observations made using the two techniques. This difficulty arises basically from the great difference in density of matter in the two devices, which varies from 0·0018 gm. cm.$^{-3}$ in an atmospheric pressure cloud chamber to 4 gm. cm.$^{-3}$ in a nuclear photographic emulsion.

This gap may be bridged to some extent by operating a cloud chamber under conditions of high pressure. For example, the density of gas in a cloud chamber operating at a pressure of 75 atmospheres in argon is 0·134 gm. cm.$^{-3}$.

High-pressure cloud chambers have been described at various times in the literature, but they have not so far been operated very extensively at high altitude; a high-pressure cloud chamber was operated by Valley on Mt. Evans in September 1948 (*Phys. Rev.*, **75**, 201; 1949), and more recently one has been operated by Kusumoto *et al.* (*Phys. Rev.*, **90**, 998; 1953) on Mt. Norikura in Japan in the summer of 1951). A cloud chamber based on a design of the late Prof. E. J. Williams has been operated at sea-level at Aberystwyth by Dr. G. R. Evans for some years since 1939, and a further chamber, based on a development of this design, has been operated in conjunction with the Harwell cyclotron by a group from University College, London, which has been investigating the scattering of 150-MeV. protons in deuterium.

Last summer, Dr. Evans's cloud chamber was set up at the University of Padua Cosmic Ray Laboratory on La Marmolada in the Dolomites at an altitude of 2,020 metres, and has now been in continuous operation for a period of fifteen months by a joint team from University College, London, and the University of Edinburgh. We appreciate very much the courtesy and generosity of Profs. A. Rostagni and A. Loria, of the University of Padua, who have provided space for this investigation in their laboratory and who have been of great assistance in arranging for the importation of the equipment into Italy and its transport to Marmolada. We are indebted to the Società Adriatica di Elettricità and its staff at Marmolada, particularly to Dr. M. Pancini, for their invaluable assistance in the erection of the apparatus and in innumerable other ways and for

* The following physicists are associated with the planning and operation of this project. From University College, London: J. P. Astbury, P. Baxter, Dr. E. H. S. Burhop, Prof. H. S. W. Massey, F.R.S., A. J. Metheringham, Dr. N. Morris, F. R. Stannard and H. S. Tomlinson; from the University of Edinburgh: Dr. G. R. Evans and E. J. Williams.

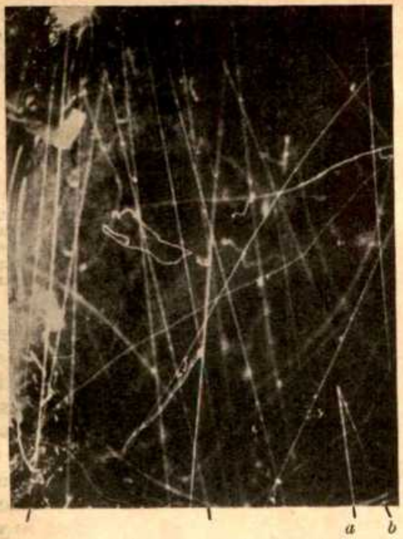

Fig. 3. Two V^0-particles, marked by tags at the foot of the photograph, produced in the same shower

52^{+35}_{-15}, 38^{+17}_{-10}, and 44^{+30}_{-13} MeV. These values depend on estimates of $p\beta$ obtained using multiple scattering, and they assume the absence of distortion.

(2) One V^0 particle originating in a nuclear interaction in the gas (Fig. 4).

(3) Five particles that come to rest in the chamber produce subsequent decays. Range and multiple-scattering measurements give for one of these particles a mass of $1{,}450^{+800}_{-450}\, m_e$.

(4) There are about sixty examples of deflexions or decays in flight of penetrating particles. With the high-pressure chamber, the vast majority of these events are likely to be deflexions.

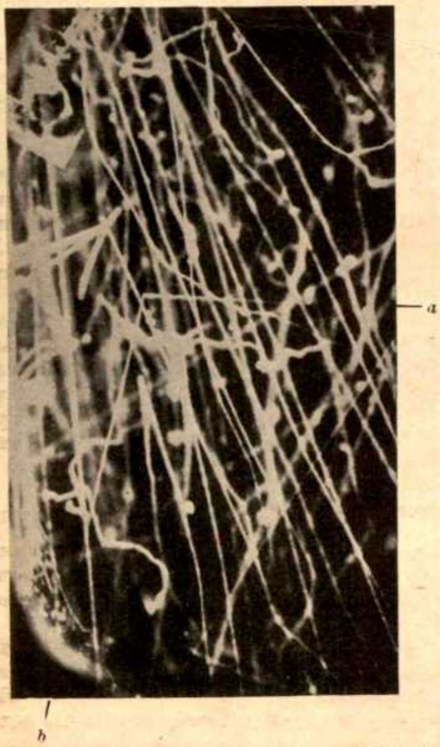

Fig. 4. V^0-particle coming from a star in the gas of the chamber

(5) Twenty particles that come to rest in the chamber without producing charged decay products have been identified as protons from range – multiple scattering measurements. Combining the individual mass values for these particles gives a mass of $1{,}750 \pm 190 m_e$.

(6) There are forty nuclear interactions in the gas. One particularly energetic star is shown in Fig. 5.

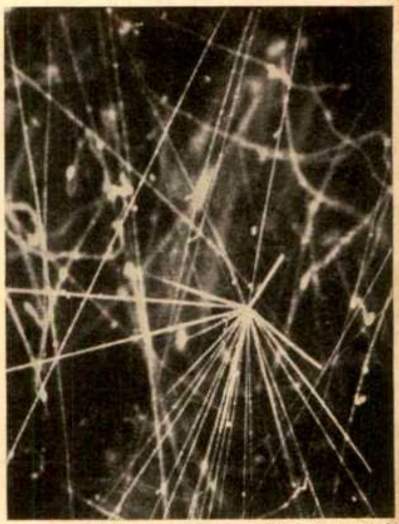

Fig. 5. A charged primary produces a 23-prong star in the gas of the chamber

Figs. 3–5 illustrate some of the more striking events that have so far been photographed.

Fig. 3 shows two V^0 events accompanying a local penetrating shower produced in the wall of the chamber. The source of the shower in the chamber wall can be located to within 1 mm., and the co-planarity of the two V's with this source can be established to better than 1°.

Unfortunately, the left-hand V has very poor-quality tracks, due to the event being out of focus. However, from a consideration of the angles, we find that if the event were a Λ^0 decay, the proton should have stopped in the chamber, whereas both tracks pass out of the chamber and appear to be those of quite fast particles.

We conclude, therefore, that the left-hand V is not a Λ^0, but is consistent with a θ^0 decay.

For the other V, assuming arm a to be a π-meson, it will have an energy of 15 MeV. for either the Λ^0 or θ^0 interpretation, while the corresponding values of $p\beta$ for arm b will be 500 MeV./c. and 800 MeV./c. respectively. Both these values are too high for our multiple-scattering techniques, and either would be consistent with the observed absence of multiple scattering. However, width measurements on arm b show that it could not be a π-meson with $p\beta$ of 800 MeV./c. We therefore conclude that this V event is not a θ^0 decay.

Fig. 4 shows a V^0 event associated with a star produced in the gas of the chamber. This low-energy star, which has a neutral primary, occurs in a local penetrating shower and has six prongs. The angle between the arms of the V is 88°. Since the projection of arm a on the film is very nearly parallel to the line joining the lenses of the camera, it is difficult to determine the orientation in space of arm a, and co-planarity of the V with the star can only be established to within 10°. There are, however, no other obvious origins for the V^0. Consideration of angles rules out completely the interpretation of the event as a Λ^0, for if such were the case, arm *a* would be the proton and would have stopped in the gas in 1·5 cm., compared with its observed length of 6 cm., before passing out of the illumination.

Multiple-scattering measurements give $p\beta$'s of 300 MeV./c. and 200 MeV./c. for the two arms. It is difficult to gauge the accuracy of these results as the scattering is very small at these values. However, the transverse momenta are 205 and 175 MeV. respectively, and check satisfactorily; and the Q value comes out to be ~ 200 MeV. The errors in the Q value will be of the order of ± 100 MeV.

The most one can say, therefore, is that the event is consistent with a θ^0 and could not possibly be a Λ^0 of Q value 37 MeV.

Fig. 5 shows a star of twenty-three prongs produced in the gas of the chamber by a charged primary. There are twelve tracks of minimum ionization; but their apparent association in pairs is not borne out when the event is reprojected in space. Of the four tracks that stop in the gas, two at least appear to be α-particles. Assuming the event represents the break-up of an argon nucleus, at least six of the minimum ionization tracks must be mesons and the energy of the incident particle must exceed 2,000 MeV.

We are indebted to the Department of Scientific and Industrial Research for the award of a Special Development Grant which has helped to finance this project, and for the award of maintenance grants to several of the research workers associated with it (A. J. M., F. R. S.). We also wish to thank the University of London Central Research Fund for the award of grants for travelling and maintenance expenses of others (P. B., E. H. S. B.). One of us (P. B.) is indebted to the Ministry of Education for the award of an F.E.T.S. Grant. We wish also to thank the Government Grant Committee of the Royal Society for an award to one of us (G. R. E.) which enabled the construction of the chamber.

DESIGN AND EVALUATION OF LARGE-SCALE RAIN-MAKING EXPERIMENTS

By B. J. MASON

Imperial College of Science and Technology, London

THE demonstration in recent years that suitable clouds may be made to precipitate by the introduction of artificial nuclei and the possibility of extending the techniques to produce economically important increases in rainfall has created the greatest interest and controversy. This is certainly an exciting new development in atmospheric physics, and, whatever may be the ultimate consequences, it has given a new impetus to researches on the fundamental physics of clouds and precipitation. The purpose of this article is to discuss the present scientific status of rain-making experiments, the fundamental problems which they pose, and what will be involved in the proper execution and evaluation of a large-scale trial with reference to conditions in Great Britain.

Physical Basis of Cloud Seeding

The observational and theoretical studies of the past few years have thrown much light on the nature of the physical processes responsible for the release of precipitation from clouds. It is now fairly well established that in widespread layer-cloud systems the dominant mechanism involves the growth of ice crystals in the supercooled region of the cloud, their aggregation to form snowflakes and, below the 0° C. isotherm, the melting of the latter to form raindrops. In non-supercooled layer clouds, which are generally rather thin, coalescences between water droplets of different sizes and speeds of falling may give rise to drizzle or, perhaps, very light rain. In shower (cumulus) clouds the relatively strong upcurrents and high concentrations of liquid water favour the coalescence process so that, in warm weather, showers may fall from clouds which are wholly below the 0° C. isotherm.

Rain-making experiments are therefore based on three main assumptions: that the presence of either ice crystals or comparatively large water droplets (to initiate the coalescence process) is essential to the natural release of rain from clouds; that some clouds precipitate inefficiently, or not at all, because these agents are naturally deficient; that this deficiency can be remedied by 'seeding' the clouds artificially with either 'dry ice' or silver iodide to produce ice crystals, or by introducing water droplets or large hygroscopic nuclei.

There is no doubt that the introduction of these seeding agents into suitable clouds is often followed by observable effects. It has been shown beyond all reasonable doubt that cumulus clouds in a suitable state of development can be induced to rain by seeding them with 'dry ice' from aircraft when similar unseeded clouds in the neighbourhood do not precipitate. The spraying of water droplets or large hygroscopic nuclei from aircraft promises to be an efficient method of releasing showers from warm cumulus clouds, and some interesting trials have recently been made in East Africa[1] with balloon-borne bombs containing gunpowder mixed with either silver iodide or finely ground salt. These experiments on individual, isolated clouds are of considerable scientific interest and may well throw new light on the precipitation mechanisms and their control by the large-scale features of cloud development. They are, however, unlikely to tell us very much about the possibilities of modifying the rainfall from widespread cloud systems extending over thousands of square miles.

Status of Large-scale Trials

For experiments on a large scale, it becomes uneconomic to disperse the seeding agent from aircraft, and the general practice is to release silver iodide in the form of a smoke from the ground, relying on the air currents to carry it up into the supercooled regions of the cloud mass. Trials of this type have been carried out on a large scale during the past six years, mainly in the United States, Canada and South America, by commercial operators.

The general procedure is to set up silver iodide generators at intervals of about ten miles along a line roughly perpendicular to the prevailing wind and to switch these on when the arrival of suitable storms in the target area is imminent. Seeding is generally continued during the passage of the storm, the working hypothesis being that seeding may cause an increase in the precipitation over that which would fall naturally. Two types of generator are in common use. In one, a 2 per cent solution of silver iodide in acetone is atomized in a propane or butane flame, silver iodide being vaporized at the rate of about 0 1 gm./min. to give about 10^{12} particles per second. In a second type, coke nuts impregnated with the silver iodide solution are burned in a crucible furnace, the normal output being about 10^{13} particles per second.

In the evaluation of these trials, the commercial operators usually adopt one of two techniques. In the 'percentage of normal' method, the rainfall at each station in the target area during seeding is expressed as a percentage of the historical average for that station—generally on a monthly basis. Maps are then drawn showing isopleths of rainfall expressed as a percentage of the monthly normal. This method may give highly spurious results since natural precipitation for a month, or any relatively short period of time, is invariably either above or below the average taken over some longer period, in other words, the weather is so variable that the climatic normal rarely occurs. It must also be remembered that commercial operators only seed under conditions favourable for precipitation, and therefore rainfall above average during a wet month is highly probable with or without seeding activities.

In the other method, the operator chooses an adjacent control region unlikely to be affected by the silver iodide smoke, and the method of evaluation generally adopted is to form a regression for the rainfall in the target area on that in the control area using historical data. Knowing the rainfall occurring in the control area during the seeding operations, the regression is used for predicting that which would fall naturally in the target area, the difference between the latter and the actual amount being attributed to the effects of seeding at a level of significance determined by the scatter of the historical data about the regression line. With this method, the apparent changes due to seeding can be statistically significant only if there is a high correlation between past rainfall in the target and control areas It has the serious disadvantage that quite different estimates of the seeding effects can be made with different lengths of historical record and different sets of target and control stations used in establishing the regression, while separate regressions can apply for different types of storm. Thus, independent evaluations of a given operation have sometimes arrived at quite different conclusions. Furthermore, if the pattern of the major storms during the seeded period differs appreciably from the average long-term pattern on which the regression is based, then the latter cannot be used to predict accurately the rainfall in the target area and consequently the assessment of the trial may be most misleading. An alternative approach might be to use the rainfall per storm as the unit and to form separate regressions for storms of the same general type, taking into account the position of the storm track relative to the target and control areas. This, however, would involve a synoptic analysis of each storm and smaller statistical samples. The same objections apply to multiple regression techniques in which the daily rainfall is correlated with a number of meteorological parameters.

From the published accounts of large-scale seeding operations one can find no convincing evidence that large increases in rainfall can be produced consistently over large areas. Although it is feasible that, under suitable conditions, marginal effects of, say, 10–20 per cent may be produced, in general, operations in any one area have not been continued for a sufficiently long period and have not been designed for use with evaluation techniques sufficiently reliable and sensitive to separate effects of this magnitude from the random variations in natural rainfall.

Some Basic Physical Problems

Apart from doubts about the validity of the statistical procedures which have been used to assess massive cloud-seeding operations, they are conducted on certain assumptions which are insecurely based, as may be illustrated by our present inability to answer the following leading questions: (a) How often in a given locality, and under what conditions, are natural ice nuclei deficient and when, and in what quantities, should they be supplied artificially ? (b) When silver iodide smoke is released from the ground, does it reach the supercooled regions of the cloud ? If so, in what concentration, and how will this vary with distance from the source at these levels ? (c) For how long does silver iodide remain active as an ice-forming nucleus under specified atmospheric conditions ?

There is some observational evidence to suggest that, while the probability of precipitation falling from supercooled clouds over Europe tends to increase rather sharply when their summit temperatures are below about −12° C., an appreciable fraction of clouds do not precipitate even on reaching the −20° C. isotherm Some of these latter may fail to satisfy certain structural and dynamical requirements, but in some cases it may be that the requisite ice-forming nuclei are deficient. Ice crystals rarely appear in significant numbers in clouds which are warmer than −10° C. 'Dry ice' will produce crystals in a supercooled cloud at temperatures below −1° C, while silver iodide produces a small number of ice crystals at about −5° C. and becomes fully active below about −10° C. In order to determine when and in what concentrations artificial nuclei might be advantageously supplied, one would wish to know the optimum concentration of nuclei for the release of precipitation from a cloud system of given characteristics, and the number of natural nuclei which are active at various temperatures in the air mass. This implies that measurements of the ice-nucleus spectrum should be made at various levels in the free atmosphere and correlated with such factors as the meteorological conditions, the origin and track of the air mass, the geography and topography of the region, the nature of the terrain and the location of possible sources of nuclei Such a programme would entail enormous labour and expense, and in view of the few measurements made with cloud chambers on aircraft which indicate that the more efficient nuclei (active at temperatures above −20° C.) occur only sporadically, it appears impracticable. In any event, because of the high degree of uncertainty involved in relating the number of ice crystals appearing in expansion—and mixing—cloud chambers to the ice-nucleus content of the free air, this method will not give reliable values of the absolute concentrations of nuclei as a function of temperature, although it may be useful in indicating whether a certain minimum concentration is exceeded, and the relative concentrations of nuclei acting at different temperatures. The problem is further complicated by the fact that the concentrations of *ice nuclei* in clear air may bear very little relation to the numbers of *ice crystals* appearing in a cloud at the same temperature, because the latter may be greatly multiplied by fragmentation.

At present, there appears to be little prospect of obtaining data from which one might predict, in a given situation, the actual requirement for artificial nuclei. One therefore has to make an intelligent guess at the minimum concentration of nuclei necessary for the rain production (probably of order 1 particle/litre), and to try to ensure that this concentration of active silver iodide nuclei is achieved at levels where they may forestall the natural ice nuclei—in general, between the $-5°$ C and $-15°$ C isotherms.

This brings us to the second problem: our present knowledge on the turbulent diffusion of particles over distances of tens or hundreds of miles is almost negligible, and its study must form an essential part of any serious investigation of the potentialities of large-scale cloud seeding. The formulæ derived by Sutton[2] for the concentration of matter downwind of a continuous source can scarcely be expected to hold for the diffusion of silver iodide particles which are required to reach heights of several thousand feet and distances of up to a hundred miles downwind. In the latter circumstances, where the plume will meander laterally in response to changes in wind direction, the wind will vary with height and time, and where vertical upcurrents may be present, it is unlikely that the theory will be valid for diffusion on this scale It is therefore necessary to appeal to experiment

Some preliminary results have been reported by Braham *et al* [3], who dispersed a cloud of tiny zinc sulphide particles from a ground generator producing some 3×10^{10} particles/sec and sampled the plume from an aircraft up to heights of 4,000 ft The particles were easily detected, since they fluoresce under ultra-violet light. In neutral equilibrium conditions, with winds of 25 m.p h, they found that the average concentration across the plume was about 100 particles/m ^{3} at a range of 25 miles and fell to the minimum detectable level (50/m ^{3}) at distances of less than 100 miles from the source. This suggests that, with a source of strength 10^{13} particles/sec, the particle concentration at these distances would have exceeded 10/litre

In some very recent experiments carried out in Australia by Smith *et al.*[4], zinc sulphide and silver iodide particles were released from the ground at the same time and place, and both were traced simultaneously from an aircraft. The measured concentrations of zinc sulphide particles at distances up to 25 miles from the generator were much the same as those obtained by Braham *et al.* when adjusted for differences in generator output The ratio of the concentration of ice crystals produced by silver iodide to the concentration of zinc sulphide particles determined at various times after release was used to measure the deterioration of the ice-nucleating properties of silver iodide.

Two types of silver iodide generator were employed, one using a hydrogen flame and the other a kerosene flame, the former producing about ten times more particles for the same consumption of silver iodide With the kerosene burner, ice nucleus concentrations of about 1/litre were detected at ranges of 20–50 km. and at heights of 1 km under neutral equilibrium conditions. With the hydrogen burner, the concentrations measured at heights of a few hundred metres fell below 1/litre at ranges greater than 10 km It is important to obtain more detailed information of this character under a variety of meteorological conditions.

The decay factor of silver iodide, defined as the ratio of the concentration of ice nuclei, active at $-17°$ C., to the concentration of zinc sulphide particles, multiplied by the ratio of the outputs of the zinc sulphide and silver iodide generators, decreased very rapidly with time of exposure to the atmosphere in the case of the hydrogen burner it decreased to a value of 0 01 after merely 16 minutes, and was less rapid in the case of the kerosene burner when the activity fell to the same value only after 100 minutes There was evidence suggesting that the decay factor of the silver iodide produced by kerosene burner after one hour of exposure to the atmosphere decreased roughly logarithmically with increasing air temperature (by about one order of magnitude for a temperature rise of 10 deg C), and this receives some support from the laboratory experiments of Bolton and Qureshi[5].

To what extent the deterioration in the ice-nucleating properties of silver iodide can be attributed directly to the influence of temperature, and to what extent photolysis of the surface layers by the ultra-violet component of the solar radiation suggested by other laboratory investigations[6] may be responsible, can be decided only after further study The decay characteristics appear to depend very much on the temperature at which the smokes are produced, the method of generation, the size of the particles, the other chemicals involved in the burning process and the nature of impurities, as well as the atmospheric conditions of temperature and humidity, the latter controlling the quantity of water vapour absorbed on the particle surfaces[7]. At present, we do not understand why silver iodide can behave as a highly efficient ice nucleus, the usual explanation which stresses similarity between the crystal structures and lattice spacings of ice and silver iodide is quite inadequate. As a first stage in the detailed study of the problem, attempts will be made at the Imperial College of Science and Technology, London, to study the oriented overgrowth of ice at low temperatures on a clean face of a single crystal of silver iodide by electron diffraction techniques Meanwhile, there remains the practical problem of discovering a method of producing large numbers of silver iodide particles which will retain their efficiency as ice nuclei under atmospheric conditions.

Suggested Design for an Experiment

Even if the fundamental problems just discussed were solved, the evaluation of large-scale seeding experiments would still be very difficult. Since we are still far from being able to compute, on a purely physical basis, how much rain will fall in a given region, the effects of seeding must necessarily be assessed statistically Since it is not possible to determine with confidence whether variations of order 10 per cent may be induced artificially by short-period trials of the type described above, there is a real need for a carefully designed experiment to be continued for a period of several years.

A line of silver iodide generators might be set up roughly perpendicular to the direction of the prevailing wind so that the target area would be a fan-shaped region downwind of the generators. The area will, of course, be rather ill-defined at the edges, while the effective range of the silver iodide will be a matter for investigation, but will probably be less than a hundred miles on most occasions. As a control area, one would choose ideally an adjacent region of similar size, shape and topography, directly upwind of the generators and in which historical records show the rainfall to have a high correlation with that of the target region There should also be a roughly uniform and similar distribution of rain-gauges in the target and control areas

In order to avoid the highly spurious results which might arise if a certain weather trend persisted during the seeded period (for example, an abnormally long, wet period), seeding should be carried out on only half the suitable occasions, the selection being made by using, say, a table of random numbers A regression can then be formed for the rainfall per storm for the target stations on that for the control stations, using the historical records for a large number of past storms of the same general type. This regression is then used to predict the rainfall to be expected naturally in the target area on the occasions of seeding, knowing that in the control region The difference between the actual and predicted values of the rainfall in the target area may be attributed to seeding at a significance level evaluated by carrying out the same procedure on the non-seeded occasions, when the differences between predicted and observed rainfall may be attributed to natural variations If it should prove impracticable to find a suitable control area, the unseeded days may be used as the only control, but the uncertainty in the evaluation will then be greater Further refinements could be introduced, such as sub-dividing the target area and performing a separate analysis for each part, using more than one control region, and using more than one meteorological parameter in forming the target-control relationships Whether these will be necessary will depend on the magnitude of the effects to be sought compared with the natural variations, the number of trials, and the level of significance judged to be acceptable

In practice it will, no doubt, be very difficult to meet all the requirements of the idealized experiment, and each region will present its own peculiar problems For these reasons, it would appear sensible, before starting field trials, to conduct a mock experiment on paper using past data The idea would be to imagine that certain past storms (selected at random) were seeded and to go through the whole operation and evaluation procedures, knowing that no silver iodide was, in fact, dispersed In this way, one could investigate the natural variability of rainfall, the adequacy of the rain-gauge networks, and the relative merits of various target and control areas, and estimate for how long the experiment would have to run in order to produce a statistically acceptable result

It is expected that experiments of this general pattern together with an intensive study of related problems will be started in Britain during the present year. There are, however, many difficulties to be faced, and a clear-cut result cannot be expected within a short time.

OBITUARIES

Prof L. H. Bailey

On Christmas evening, 1954, death came to one of America's great men, the venerable Liberty Hyde Bailey, then ninety-six years of age Most great men can be classified by the profession or field of activity whereby they achieved their greatness , not so with Liberty Hyde Bailey, for his greatness is due to his manifold contributions produced almost concurrently in many fields To some persons, his renown is as a botanist, explorer and horticulturist , to others as an educator, administrator and rural sociologist , to a third group as an editor, lecturer and writer , while still a fourth group knows him best as a poet, philosopher and counsellor He was all these things, and, moreover, he was a man of forceful character, personality and energy A most excellent obituary of him appeared in *The Times* for January 11, 1955. A well-documented chronicle of his work in all fields, of his honours, and a bibliography of his seventy-odd books is to be found in *Baileya* (**3**, 26–40) (in the press).

Bailey was born and raised on a fruit farm in Michigan He was precocious as a youth, read Darwin's "On the Origin of Species" when twelve years old, and stood at the top of his class when in college His first book, "Talks Afield", published when he was twenty-eight years old, was a general botany written for the amateur This book followed his studies and work at Harvard under Asa Gray

Although Bailey wrote thirty-eight different books in the field of horticulture and agriculture, his greatest contribution was not to the field's literature, but to the reshaping of its character as an applied science He initiated what later was recognized as a revolution of methods in agricultural teaching and research This he did by execution of two dicta (1) that both the student and the faculty member participate in laboratory exercises organized as an integral part of every course , (2) that agricultural subjects of a biological nature be based on sound scientific principles, experimentation and evidence These changes in approach, from a situation where the professor had been held as above participating with his students, and from a situation where agriculture and horticulture had been viewed as crafts to be mastered by the apprentice, required years to effect Bailey and his supporters raised the academic standing in these subjects in the American university to a level where for the past quarter-century or more they have been accepted on a par with technological training in engineering

A third contribution by Bailey was his determination to carry the college of agriculture to the farm and not to restrict its facilities to the student in residence This expansion was accomplished by establishment of extension courses and assignment of workers to travel throughout New York State to assist and counsel the rural people

Bailey has been known in recent decades for his botanical work, especially that with the palms and the bramble fruits In 1892 he published his study of type specimens of *Carex* species examined and photographed by him in the leading herbaria of Great Britain and the Continent His studies of the American Carices (1883–1900) comprise eighteen papers—some monographic in scope. Taxonomic studies again received his attention from 1923 to 1949, when he commenced serious study on the systematics of the palms, the cucurbits, *Vitis*, *Rubus*, *Brassica* and others. During this time he published more than a hundred systematic papers. In this quarter-century he acquired fame as a traveller and plant explorer, and in 1949—at the age of ninety-one—visited and collected palms on nine islands of the Lesser Antilles and Tobago. Despite repeated urging, Bailey never wrote of his travels, but preferred to devote his efforts to new research.

By 1935 his private herbarium of 125,000 specimens and library of 3,000 volumes reached proportions beyond his ability to maintain and perpetuate. He and Mrs. Bailey gave them to Cornell University as the Liberty Hyde Bailey Hortorium, an institution devoted to studies on the systematics of cultivated plants. Earlier Bailey edited three encyclopædic works, of which his best known is the "Standard Cyclopedia of American Horticulture", and he has since provided botanists and horticulturists with his well-known "Manual of Cultivated Plants", the dictionary of gardening "Hortus", and its better-known successor, "Hortus Second".

Liberty Hyde Bailey was a great driving force, a rugged individualist who ruthlessly cut impeding fetters of regimentation and bureaucracy, and a man who had the capacity to develop his visions into reality. Basically, he was a humanist, always considerate of his fellow man, and of his improvement by a better knowledge and use of that which is science. He could be, and on occasion was, an egoist, a man of quick decision and action, intolerant of delay or procrastination, and one who often saw the significance of the result before considering the cost of the achievement. At the same time, he was poetically and philosophically æsthetic, sensitive to the finer qualities of life, and a man who lived a life of high personal integrity.

G. H. M. Lawrence

Mr. A. Allan Gomme, M.B.E.

Arthur Allan Gomme was born on July 15, 1882, the son of Sir Laurence Gomme, who was Clerk to the London County Council and a well-known authority on the history of London. He was educated at the Mercers School and City and Guilds Institute, where he gained his associateship. On March 1, 1904, he entered the Patent Office as an assistant examiner, and was promoted to the post of librarian of the Patent Office Library in 1920, a position which he held until his retirement from the Civil Service on April 30, 1944. He served in France in the 20th Battalion Royal Fusiliers (the University and Public Schools Battalion) during the First World War and in the Home Guard in the Second; he was made M.B.E. in 1929.

Besides being a most able and distinguished librarian in the Patent Office, Mr. Gomme did great service generally in assisting in the task of making scientific and technical information readily available to research and industrial bodies. He took a leading part in the compilation of "A World List of Scientific Periodicals", and the prefaces to the first, second and third editions of the section covering 'International Congresses' pay warm tribute to his labours. Indeed, the preface to the third edition, 1952, mentions him as a member of the council of management of the "World List" since 1935, and describes him as well known in London as an expert technical bibliographer; and it is remarked that, as well as giving the editor much sound advice, he voluntarily undertook to deal with the small but difficult section 'International Congresses'. Mr. Gomme served for thirty years as a member of the council of the Newcomen Society for the Study of the History of Engineering and Technology and was a frequent contributor to the *Transactions* of the Society. He was the author of "Patents of Invention; Origin and Growth of the Patent System in Great Britain", published in 1946.

Gomme was of a most pleasant and kindly nature, combining scholarship with courtesy. His patient assistance to all users of the Patent Office Library, whether they happened to be members of the Patent Office staff or members of the public, was very much appreciated and set a very high standard for his successors. All inquiries, from the most simple to the most academic, received the same earnest and complete attention from him. He effected considerable reorganization and rearrangement of the large collection of technical and scientific periodicals in the Patent Office Library to facilitate the work of those using it, and was always ready to listen to suggestions for increasing its scope and efficiency. Technical library circles, in which he had become a leading figure, and the Newcomen Society have sustained a great loss in his death.

H. C. Miller

NEWS and VIEWS

Chemistry at Oxford.

Sir Robert Robinson, O.M., F.R.S.

Sir Robert Robinson's retirement this summer from the Waynflete professorship of chemistry in the University of Oxford will mark the departure from active academic duties of the organic chemist who has been for many years the international leader of his science. Besides honours—the Order of Merit and the Nobel Prize—duties, such as the presidency of the Royal Society, have been so much thrust upon him that the amount of outstanding scientific research that he has still been able to direct in recent years is truly amazing. Since going to Oxford in 1931, he has supervised the work of almost three hundred research students drawn from all parts of the world; in fact, his own laboratories have had much of the character of an international post-doctorate research school which has been linked but slightly with the local activities of the University.

As successor to W. H. Perkin, Sir Robert at once extended the research prominence of the Dyson Perrins Laboratory in chemistry of natural products. To active studies of alkaloids he added investigations of plant colouring matters, steroids and other topics. The elucidations of the correct structures of penicillin, strychnine and vomicine, syntheses of several of the anthocyanin pigments and of brazilin, and finally the complete synthesis of the stereochemically correct ring system of the steroids, represent but a few of the notable successes of his Oxford work. Sir Robert has always been prominent for his contributions to the electronic theory of organic chemistry. Though but few of his later publications have dealt specifically with this subject, his ingenuity in the devising of novel organic syntheses has been due to the originality of his thoughts in the application of electronic concepts in the laboratory. Undoubtedly, recent achievements of other synthetic organic chemists throughout the world depend to a very great extent upon applications of reactions first described by Sir Robert's research school, without question this will be equally evident for many years to come

Prof E R. H. Jones, F.R.S.

Prof E R H. Jones, who is to succeed Sir Robert Robinson, is at present Sir Samuel Hall professor of chemistry in the University of Manchester He will leave Manchester after a stay of eight years, during which he has contributed much to the already high reputation of its school of chemistry. His influence in the University extends far beyond the limits of his department, for his time and wise counsels have been given generously in many directions Prof. Jones is perhaps best known for his work in the acetylene field, which he began at Manchester as a Research Fellow and continued both at the Imperial College of Science and Technology, London, and again at Manchester as professor Closely allied to this work has been the synthesis of polyenes, culminating in the synthesis of vitamin A_2. He has also contributed very largely to the knowledge of the chemistry of triterpenes and steroids and was responsible for devising a synthesis of cortisone. His interests have more recently been extended to investigations of fungal products and of plant-growth hormones such as β-indolylacetonitrile His influence on chemistry has not been confined to the researches which he has directly initiated and inspired. It has also resulted from his gift for stimulating and encouraging all his colleagues, and it is in this way that he has built up in Manchester the present very active school of organic chemistry.

Fluid Mechanics in the University of Liverpool:
Dr. J. H. Preston

Dr. J. H. Preston, reader in engineering in the University of Cambridge, has been appointed to the new chair of fluid mechanics in the University of Liverpool He will develop the study of fluid mechanics in the Department of Engineering, considering applications in civil and mechanical engineering and in naval architecture Dr. Preston joined the staff of the Aerodynamics Division, National Physical Laboratory, in 1938, after some years of research at Queen Mary College, London, and at the Imperial College of Science and Technology. His work at the National Physical Laboratory was mainly on boundary layers and their effects on the behaviour of aerofoils, and on the control of boundary layers by suction through slots or through a porous surface. In 1946 Dr. Preston was appointed lecturer in aeronautics in the University of Cambridge. At Cambridge, he continued his work on the control of boundary layers by suction and on the effects of boundary layers on the characteristics of aerofoils. He also worked on secondary flow and on problems related to the control of the circulation around an aerofoil He has recently developed a method of measuring skin friction on a surface with a turbulent boundary layer, using a single pitot tube He is now working on the prediction of skin friction at high Reynolds numbers, with special reference to ship resistance

Awards of Gauss–Weber Medals

Dr. J. M. Stagg, principal deputy director, Meteorological Office, has been awarded a Gauss–Weber medal by the Academy of Science, Gottingen, "for his researches in geomagnetism, especially his discussion of the Fort Rae Polar Year (1932–3) data and the investigations arising therefrom, so furthering the aims which Gauss and Weber envisaged when they set up the Magnetic Union in 1831". The following five Continental scientists, distinguished in the fields in which Gauss and his contemporary Weber had made fundamental contributions, also received Gauss–Weber medals Prof. Walther Bauersfeld, creator of the Zeiss planetarium (astronomy), Prof John Eggert, Zurich (astrophysics), Prof. Heinz Hopf, Zurich, for contributions to differential and algebraic geometry Prof Richard Feldtkeller, Stuttgart, for electro-acoustics and electronic measuring technique, and Prof. Werner Kleen, Munich, for work on electronic valves. The presentations were made on February 19 at a ceremony in the University Hall, Gottingen, arranged by the University and the Academy of Science to commemorate the hundredth anniversary of the death of Carl Friedrich Gauss Sir Geoffrey Taylor represented the Royal Society at the ceremony The chief address in honour of Gauss and Weber was given by Dr. Richard Courant, New York

University College of Rhodesia and Nyasaland

The following appointments, the first to be made to the academic staff of the University College of Rhodesia and Nyasaland, have been announced chair of Chemistry. Dr S. H. Harper, reader in organic chemistry, King's College, University of London, chair of African Studies Dr J. C Mitchell, director of the Rhodes–Livingstone Institute, chair of English Dr. N. H MacKenzie, senior lecturer in English in the University of Natal, Librarian. Mr. D. A. Clarke, deputy librarian of the University of Leeds

Geophysical Observatory, Quetta

The Department of Advertising, Films and Publications of the Ministry of Education, Pakistan, has issued a booklet entitled "The Geophysical Observatory, Quetta a Study in Technical Assistance" (pp 35+4 plates. Karachi Ministry of Education, 1955). As explained in the preface by S. M. Sharif, educational adviser to the Ministry of Education, a project was initiated in 1950 through an agreement between the Government of Pakistan and the United Nations Educational, Scientific and Cultural Organization, whereby expert technical advice and equipment in certain aspects of geophysics, particularly in seismology, geomagnetism and atmospheric physics, would be given, four geophysicists were recruited from various countries, including Great Britain, and arrived in Pakistan during February–June 1951. Through the service rendered by these experts and the whole-hearted co-operation of the government departments concerned, the Observatory of Quetta, in the words of the Educational Adviser, "is now ranked by competent authorities to be one of the finest institutions of its kind in South East Asia". The booklet is divided into two parts, the first of which deals with development in five different phases from the creation of Pakistan in 1947 up to recent times. The fifth phase began when, having been developed by outside help, the Observatory was in a position to offer technical assistance to other countries in the Middle East and South-East Asia which require the same assistance that has been given to Pakistan. Part 2 of the booklet deals with this scheme under the heading of "Training and Research Facilities", with sections on the climate, the buildings, seismology, geomagnetism, atmospheric physics, library, workshop and drawing offices, other facilities, Observatory publications, and general. The main emphasis of the Observatory is on practical work, and the standard is suitable for graduates in physics and mathematics, and also for geologists who have studied physics and have an aptitude for experimental physics. It is suggested that external students should stay at least six months and preferably nine to twelve months. Pakistan students are accepted for long-vacation courses, and, while instruments in regular use cannot be handled by them, they will receive facilities to learn all about their care, maintenance and adjustment. Short illustrated lectures are planned to guide students in practical activities, and visits to the Geological Survey, the chrome mines and the coal-mining areas near Quetta will also be arranged.

Bell Laboratories Record

All those who are concerned with the science and practice of electrical communication should be interested in the *Bell Laboratories Record*, a well-produced and excellently illustrated monthly journal published by the Bell Telephone Laboratories, 463 West Street, New York 14. A perusal of recent issues shows that it deals with a wide variety of subjects ranging from the study of semi-conductors and the fundamental principles of television to the policy and technical problems involved in the planning and operation of a nation-wide telephone service. The December 1954 issue contains several features of interest to those concerned with some of the latest advances in radio techniques.

Ratio of Iron to Manganese in Plants

Continuing their studies on the mineral nutrition of plants, W. Leach and C. D. Taper have investigated the absorption of iron and manganese by various plant species grown in culture solutions (*Canad. J. Bot.*, 32, No. 5, 561; 1954). Dwarf kidney beans and tomatoes were grown in complete nutrient solutions containing various concentrations of iron and manganese. The ratio of iron to manganese must be within a definite range in order to avoid deficiency symptoms in the experimental plants, namely, 1·5–3·0 for dwarf beans and 0·5–5·0 for tomatoes. Concentration ratios outside the optimum range produced deficiency symptoms of one or other of these elements. Concentrations below minimum values of both elements always produced deficiency symptoms irrespective of the iron/manganese ratio in the culture solutions. An apparent antagonism between the absorption of iron and manganese was observed with both species, as also with onion. The combined amount of iron plus manganese absorbed appeared to remain constant irrespective of the ratio of iron to manganese in the culture solution.

John Innes Horticultural Institution Leaflets

Originally prepared to put the grower, the gardener and the seedsman into touch with the latest results of research, the well-known John Innes leaflets were first brought together in volume form in 1948 under the heading of "The Fruit, the Seed and the Soil". The publication was extremely successful, and, one year later, a new volume was issued containing all the original leaflets and three new ones. A third edition of the work has now been prepared in which substantial additions have been made to the leaflets dealing with growing tomatoes out of doors and sweet corn in England, while the leaflets concerned with composts, soil sterilization, raising plants in soil blocks, the fertility rules in fruit planting and making new plants by the colchicine method have been brought up to date.

Chicago Natural History Museum

On behalf of the division of birds of the Chicago Natural History Museum, Austin L. Rand and Emmet R. Blake have prepared a delightful handbook illustrating the way the bird collections are set out. These are now arranged in habitat groups, the landscapes and the birds having been brought together from points as far apart as the Bering Sea and Antarctica; areas as widely scattered as Scotland, Chicago, Indo-China, the Kalahari Desert, New Zealand and Laysan Island are also represented. The specimens and accessory materials for the thirty-two habitat groups were either collected by museum expeditions or obtained through the generosity of friends of the Museum. A green peafowl exhibit was obtained as the result of a special expedition to French Indo-China. The emperor penguins were captured by the Byrd Antarctic Expedition of 1935, while the white stork exhibit was the gift of the Polish American Chamber of Commerce, Warsaw. The book is illustrated by some fine colour and black-and-white photographs, line-drawings of distinction and a cover design of outstanding merit.

International Pharmaceutical Federation

The sixteenth general assembly of the Fédération Internationale Pharmaceutique will be held in London during September 19–23, and is being organized by the Pharmaceutical Society of Great Britain. The opening and closing sessions and the science symposia will be held in Friends House, Euston Road, where a simultaneous translation service in English, French and German will be provided; the meetings of the sections will be in the Senate House, University of London. There will be four symposia, in which invited speakers will present papers, to be followed by general discussion; the subjects of the symposia will be: the pharmacy of blood, blood products and blood substitutes; recent advances in pharmaceutical analysis; ion exchange; and tests for the sterility of pharmaceutical preparations. The secretary of the Organizing Committee is D. F. Lewis, Pharmaceutical Society, 17 Bloomsbury Square, London, W.C.1.

Colonial Service: Recent Appointments

The following appointments have recently been made in the Colonial Service: A. E. Billington (canning officer, Agricultural Department, Federation of Malaya), senior chemist, Agricultural Department, Federation of Malaya; E. R. H. Martin (agricultural officer, Antigua), agricultural officer, Jamaica; R. B. Reid (agricultural officer, Northern Rhodesia), chief agricultural officer, Northern Rhodesia; A. Jackson (chief chemist, Federation of Malaya), director of chemistry, Federation of Malaya; Tham Ah Kow (fisheries research officer, Singapore), fisheries officer, Singapore; A. J. Browning (assistant conservator of forests, Sierra Leone), senior assistant conservator of forests, Sierra Leone; H. C. M. Parr (senior scientific officer, Tanganyika), senior scientific officer, Uganda; J. MacDonald and W. N. Scott (veterinary officers, Uganda), assistant directors of veterinary services (field), Uganda; J. L. Anderson, agricultural officer, Western Region, Nigeria; D. Jordan, agricultural officer, Gambia; R. E. Taylor, fisheries officer, Somaliland Protectorate; B. Plasecki, utilization officer, Forestry Department, Gold Coast; Miss A. P. M. Lynam, records officer, Geological Survey Department, Uganda; L. C. Cronje, entomologist, Tsetse Control, Gold Coast; D. N. McNutt, entomologist, Uganda; E. H. Roberts, scientific officer (botanist), Sierra Leone; F. J. W. Hampshire, veterinary officer, Tanganyika; J. A. Armstrong, entomologist, Tanganyika.

Announcements

Prof. T. von Kármán and Sir Lawrence Bragg have been elected foreign associates of the Paris Academy of Sciences.

Dr. W. C. Osman Hill, prosector of the Zoological Society of London, has been awarded the Makdougall–Brisbane Prize for the period 1952–54 of the Royal Society of Edinburgh for his papers on marsupials and lemurs in the publications of the Society, during the period of the award, and for his notable contributions on the structure, behaviour and systematics of the primates.

Prof. H. W. Melville, Mason professor and head of the Department of Chemistry in the University of Birmingham, will deliver the sixth annual lecture of the Plastics Institute on March 15 at 6.30 p.m. in the Manchester College of Technology. He will speak on "New Kinds of Macromolecules".

Academician W. Engelhardt, professor of biochemistry in the University of Moscow, will deliver a lecture on "Biochemistry in the U.S.S.R." on March 14, at 7.30 p.m., at the Society for Cultural Relations with the U.S.S.R., 14 Kensington Square, London, W.8 (admission, 2*s.* 6*d.*; members of the Society and students, 2*s.*).

The eighth Brookhaven Symposium in Biology, sponsored annually by the Biology Department of the Brookhaven National Laboratory, Upton, N.Y., will be held during June 15–17, the subject this year being mutation. Those wishing to attend should notify Dr. R. C. King at the above address by May 21.

The Electron Microscopy Group of the Institute of Physics will hold its summer conference in the Chemistry Department of the University of Glasgow during July 5–7. Hostel accommodation must be booked by March 31, and notice of intended papers must be sent by April 30. Further information can be obtained from the honorary secretary, Dr. C. E. Challice, Wright–Fleming Institute, St. Mary's Hospital, London, W.2.

The sixth Canadian High Polymer Forum, sponsored jointly by the Chemical Institute of Canada and the National Research Council of Canada, will be held in Ridley College, St. Catherines, Ontario, during April 14–15. At a dinner to be held on the evening of the first day, Dr. R. L. Anthony, of the University of Notre Dame, will speak on "The Physicist's Approach to High Polymers". A preliminary programme and booklet of abstracts of papers are available from Dr. H. Leverne Williams, Polymer Corporation, Ltd., Sarnia, Ontario, from whom further information can be obtained.

A symposium on astronomical optics and related subjects will be held in the University of Manchester during April 19–22 under the auspices of the Department of Astronomy. The aim of the symposium is to provide a forum of discussion for certain topics of modern optical research, both theoretical and experimental, of special interest at the present time, with particular reference to subjects which have a bearing on astronomical observation. Further information can be obtained from the secretaries of the meetings, Dr. W. L. Wilcock or Dr. E. Wolf, Department of Astronomy, University, Manchester 13.

About £30 is available from the Clough Memorial Research Fund of the Edinburgh Geological Society for geological research in Scotland and the north of England (Northumberland, Durham, Cumberland, Westmorland and Yorkshire) during the period April 1955–March 1956. Applications for grants from this Fund must be sent before March 31 to the Honorary Secretary, Edinburgh Geological Society, Synod Hall, Castle Terrace, Edinburgh 1, from whom further information can be obtained.

The Mond Nickel Fellowships Committee is offering up to five travelling fellowships, open to persons of British nationality with degree or similar qualifications, not necessarily in metallurgy, so that they can obtain wider experience and training in industrial establishments (in special circumstances, at a university) in order to make them more suitable for employment in technical and/or executive positions in British metallurgical industries. Each fellowship will occupy one full working year and will be worth £900–1,200. There are no age limits, but awards will seldom be made to persons more than thirty-five years of age. Application forms, to be completed by June 1, and further information can be obtained from the Secretary, Mond Nickel Fellowships Committee, 4 Grosvenor Gardens, London, S.W.1.

The second issue of the "Supplement" (pp. 334) to Vol. 12, Series 9 (1954), of *Il Nuovo Cimento*, containing the proceedings of the international symposium on unstable heavy particles and high-energy events in cosmic rays, held in Padua during April 12–15, 1954, has recently appeared. The issue includes sections on pi-mesons, K-mesons, charged and neutral hyperons, unstable nuclear fragments, cloud-chamber work, jets and high-energy slower particles, recommendations for the standardization of measurements in photographic emulsions, and a report on the Sardinia expedition of 1953. A limited number of copies is available to non-subscribers, and those wishing to obtain a copy (price, 300 lire plus postal charges) should write as soon as possible to Nicola Zanichelli, Editore, via Irnerio 34, Bologna, Italy.

The headquarters of the Museums Association have been moved from the Meteorological Buildings, South Kensington, London, S.W.7, to a Georgian house which the Association has purchased at 33 Fitzroy Street, London, W.1. The move was necessitated by the extensive rearrangements in connexion with the enlargement of the Imperial College of Science and Technology.

Referring to the communication entitled "Chemotherapeutic Experiments with Natural Constituents of the Body" in *Nature*, September 18, 1954, p. 555, Dr. H. Meyer-Doring states that all the mixtures (1–6) mentioned in par. 8 were ineffective except the compound cysteinylascorbic acid.

PROBLEMS IN COMMUNICATING INFORMATION

AT the present time, when communication is being examined from many theoretical points of view, an empirical discussion grounded in research seemed desirable, and the Northern Branch of the British Psychological Society, meeting at the University of Leeds on February 12, provided a suitable forum Of the five participants, all had a practical interest in communication, and between them they represented its literary, scientific, industrial and psychological aspects. All are actively engaged in research in one or other aspects of communication. The discussion never soared philosophically but was focused mainly upon the problem of transmitting scientific data and concepts, with particular emphasis upon the industrial 'consumers' of science

The symposium provided an occasion for reviewing the preliminary findings in a piece of research on "the comprehensibility of technical reports" undertaken six months ago by the Department of Psychology, University of Leeds, with a grant from the Department of Scientific and Industrial Research It should be made clear that these 'findings' are no more than first impressions concerning the nature of the problem itself—namely, the problem of easing and increasing the flow of information from the laboratory to the factory, a problem with an obvious bearing upon industrial productivity. All those who are familiar with the facts of the matter will appreciate the difficulty in finding any clear track through the maze of diverse practices, materials, documents and human attitudes in this field The discussion, here summarized, was intended primarily to indicate methods of approach Its scope is indicated by the programme the comprehension of technical literature in the factory (Miss Frances Crisp, Department of Psychology, Leeds), experimental studies of scientific vocabulary in relation to comprehension (Dr W E Flood, Department of Education, Birmingham), problems of research in reading and comprehension (Miss M. E Meek, Institute of Education, Leeds), and some methodological problems concerning the flow of information (Dr. R Harper and Prof. G. P Meredith, Department of Psychology, Leeds)

Miss Crisp confined her remarks to conditions in the wool textile industry, where for obvious geographical reasons she has done her preliminary fieldwork. This is not a 'typical' industry, but what industry is typical? It is an industry in which historical factors play a still dominant part, not only in the industry as a whole but also in individual works, a history of persistent competitiveness in which the need for a 'flow of information' is criss-crossed by habits of mutual secrecy concerning specialized bits of 'know-how' Her inquiries concerning the flow of literature showed that, while there is much wastage through indiscriminate distribution, clearly illustrated material has a way of attracting attention, sometimes unexpectedly and with beneficial results Advertising can be a valuable vehicle of information, although the reluctance of many British advertisers to state prices is a hindrance. With scientific journals the time-lag in publication is a serious brake upon the rapid transmission of information. An even more serious obstacle is the style in which many scientific papers are written Industrial readers frequently find them unduly ponderous, and would show greater interest in research if they understood more of what was written. The need for someone to play an interpretative part between the scientist and the industrial reader was a point taken up later in the symposium.

Dr Flood's contribution, while not specifically concerned with industrial readers but rather with the popularization of science, directed attention to a technique which may well have something to offer to the problem of reducing the difficulty of scientific communication to industry. His paper referred to a number of investigations on popular reading matter and scientific broadcasts in which vocabulary was revealed as a decisive factor in comprehensibility He described the method by which he and Michael West compiled their two-thousand word vocabulary, with the aid of which they were enabled to construct a dictionary of scientific terms (One may comment here that this principle of 'communication by vocabulary-control' can be appreciated only if its restriction to popular communication is borne in mind, it is clearly out of place in communication between experts) A variety of examples illustrated the process of translation, of which a brief extract must here suffice Original "The foliage is usually persistent. The leaves are linear, linear-lanceolate, acicular or squamiform and have simple venation The leaf-surface is often glabrous or lustrous". Translation in Flood–West vocabulary · "The leaves usually last for several years They are straight and narrow, thin spear-shaped, needle-shaped or scale-like and the veins are simply arranged. The surface of the leaf is often smooth or shiny".

Dr. Flood also dealt with the understanding of concepts in so far as these have an inherent difficulty independent of vocabulary, and this was a matter further explored in the next paper, by Miss Margaret Meek Here the symposium swung over to the reader's end of the communication process. While there are obvious problems in the very varying degree of actual reading skill (witness the spread of 'reading clinics' in the United States and the recent interest aroused in Great Britain), Miss Meek made it plain that comprehension, the final yield of the reading-process, demands something more than reading-skill in the current sense, and something more than a grasp of vocabulary. "As words do not have a one-to-one relationship with facts, but are dependent for their meaning not only on the context in which they occur but also on the associations they have for the reader . . . 'word-meanings' offer both an excellent way and a wholly wrong way of discovering what the reader has understood of a passage . . Comprehension is a cumulative process, a blending of the old information with the new" Miss Meek referred to the role of clues, allusions, metaphors and archaic meanings She stressed the importance of motivation, attitude and preconception She criticized the atomicity and frequent irrelevance of much of the testing of comprehension (One might here recommend examiners to pay heed.) She urged the need to penetrate successive levels of comprehension by techniques which permit the reader to show in his own terms what a passage has meant for him Here the psychological fact that reading is not an isolated cognitive activity, but an engagement of imagination and personality itself, emerged as the considered outcome of Miss Meek's researches

Dr. Harper gave a broad survey of the 'flow of information' regarded as a scientific problem, with the view of establishing the significant variables in the process. He characterized our present knowledge in this field as no more than a "natural history stage". He used the term "information" not in the current but still esoteric cybernetic sense, but simply as a "composite of facts, ideas, knowledge and techniques". Dr Harper divided the field up into (1) media and methods, (2) material or message, and (3) focal points. Under (1) he listed as four major points of inquiry use of language, size and type of groups, use of visual aids, and the scope for interaction and 'feed-back' The B B C. concept of the 'target audience' is relevant here, under the heading of size and type of groups. He indicated the need for much greater specificity of aim if communication is to be effective This applies equally to (2), that is, content of message. Under (3) he developed an interesting series of parallels between human and electronic communication while stressing the radical differences in the nature of the processes themselves, and he reminded would-be communicators of the axiom of "training within industry" that "if the worker has not learned, the teacher has not taught". He also emphasized Miss Meek's theme of the over-riding importance of attitudes and human motivation.

Prof. Meredith, in his concluding contribution to the symposium, stressed the differences rather than the parallels between human communication and communication-engineering Basically our problem concerns a relation between the man in the laboratory and the man in the factory, differing in outlook, training and mode of life, yet mutually dependent. The scientific document is a slender and inadequate link between them The man of science, if intent on his research, cannot usually make himself expert in communication techniques The industrial expert has reasons, some good, some bad, for resisting knowledge which may change his practice The advance of science must be matched by a corresponding advance in methods of communication. Improved communication demands not less but more stress on human factors. Effective communication of the basic knowledge factors—materials, properties, processes, laws, concepts, historical bases and operational prescriptions—demands at its fullest a 'six-pronged invasion force' of verbal, diagrammatic, pictorial, filmic, material and human carriers, under the command of an appropriately trained 'communications officer'.

G. P. MEREDITH

HEALTH OF SCHOOL CHILDREN

PARENTS and others interested in the welfare of children will find, in the report of the Chief Medical Officer of the Ministry of Education for the years 1952 and 1953 (H.M S O, 1954, 5s. net), much that will interest and please them. Everywhere, the report assures us, the health of the children is satisfactory. In 1953 only 2 2 per cent of the children were considered by school doctors to be in poor general condition Thanks to immunization, diphtheria is now a rare disease, and let us hope that everyone concerned, parents included, will co-operate to maintain this protection from a dreadful disease. Rickets scarcely exists, and if tetanus (lockjaw) could be also banished by similar measures, so much the better. Among children aged 5–14 suffering acute infectious diseases, about 90 per cent suffered from measles, whooping cough and scarlet fever. There has been, in recent years, a remarkable decrease in the number of deaths among children aged 5–14 from tuberculosis In 1938 the number of children of this age-group who died of this disease was 973, whereas in 1952 it was 168, and in 1953, 107. In general, the incidence of acute rheumatism has also fallen sharply during the past ten years, but there have been exceptions in certain areas, and several principal school medical officers have reported an increase, in 1952 and 1953, of the number of children with rheumatic heart disease. There were still more than a quarter of a million children with nits and lice, but the number of verminous children was, nevertheless, the smallest known in the history of the school medical service Among the other subjects discussed by the report are food poisoning in schools, middle-ear disease and that puzzling bugbear of the parent, poliomyelitis

Less reassuring is the section dealing with dental caries, which has increased, and there is strong evidence that sweet and sticky articles of diet are important causes of decay of teeth. The consumption of sugar per head of the population rose in 1946 (immediately after the War) and has continued at a higher level. It is suggested that reduction of sweet and sticky foods would reduce dental caries considerably.

The report strongly urges the retention, wherever this is possible, of handicapped children in the ordinary schools. Most of them have to go to work when they leave school and their school life should not be too sheltered. It is expected that early auditory training and the teaching of lip-reading will enable more children with defective hearing to attend ordinary schools in the future. Children with defective sight are already attending these schools more and more, and those with defective speech can be trained in them. Very severely handicapped children should not however, be educated at the expense of other children, nor should teachers be asked to bear responsibilities in this respect that may be too exacting. For handicapped children, 222 new special schools have been opened since 1945, and these accommodate 14,165 handicapped children. Among them are 30 hospital special schools, in which about 8,000 children are being taught An innovation in 1953 was the establishment, by the Diabetic Association, of three camps for diabetic children, in which these children can have a holiday with special care and diet. The British Epilepsy Association made a similar arrangement for epileptic children. An interesting chapter of the report discusses the baffling problem of asthma, on which much research is being done A limited number of asthmatic children have been sent abroad for treatment, but medical opinion is divided about the wisdom of this procedure.

The introduction of the National Health Service has not had any serious effect on the School Health Service, but its provision of 'free' service by a general practitioner may have helped to reduce the number of children who attend clinics for minor ailments. School doctors in general have reported better co-operation between the general practitioners and themselves than ever before

It is now nearly fifty years since the School Medical Service in Britain began, and it has, during that period, expanded without interruption. It has, in conjunction with improvements in the standard of living and in family and general care, very greatly improved the health and cleanliness of the children, so that it is now possible for the Service to give more attention to the needs of individual children. Everyone who is responsible for children in any way, or is otherwise interested in their welfare, will be grateful to every member of this Service, whose patience and devotion and efficiency are giving to so many a start in life that is now so much better than it was.

G Lapage

RELIGIOUS AND BIOLOGICAL TEACHING

In a short paper devoted to religious and biological teaching in schools on the origin of life and man, Dr L M J Kramer examines the divergence in educational practice between what he calls the Sunday School, biblical or religious approach to the question of life's and man's origin and the formal scientific and biological teaching about them in schools* There is always the danger of setting young minds along one of two equally undesirable paths, one materialistic or even anti-religious, and the other taking too little account of the strong appeal of science to the intellect Before this educational divergence can be reduced, an intellectually satisfying reconciliation of religion as a whole with science as a whole is necessary, and a teacher of religion, or of science, who has not made a reconciliation for himself may be ineffective as a leader of thought Whatever view we take, evolutionary biology appears as an important social factor, affecting beliefs, and beliefs often precede or condition our actions Biology teachers in particular wield a powerful social tool, and should be careful how they do so.

The relationship of evolution to religion is not a new problem There have been, however, recent developments in both evolutionary studies and cognate matters and in religious thought

In his paper, Kramer reviews some of the newer scientific work and discusses how it may affect school practices, and also attempts to follow some religious trends before suggesting ways along which a reconciliation of science, including evolution, with religion may be reached. There are, he believes, four tests which may be applied before reconciliation is achieved.

The first test is that the strong appeal of science to the reason exposes young students to two dangers One is that of becoming a prisoner of the reason, requiring material signs and practical evidence for views held in almost every department of life, even for religious beliefs The second danger, which frequently accompanies the materialistic view, is of losing the power to appreciate simple or beautiful things in Nature or the arts

Those who grow into such an extreme state of mind are bound to be superficial in their approach to the deeper problems of life Yet even those who are believers in God and sincere Christians may feel the compelling influences of intellect and reason in connexion with physical matters. The first test of a valid reconciliation must be that it shall provide an escape for prisoners of the reason and also satisfy others who are not unmindful of the appeal to their reason.

The second test of a true reconciliation is that it must be emotionally satisfying It is not infrequently found that young people mistaking the applications of science to the production of destructive weapons for the quest for truth develop a strong antipathy to the logical processes of thought by which science often achieves its ends and effects They try to ignore science and become prisoners of strong emotions. The second test of a true reconciliation is that it must provide a different route of escape from that for the intellectual prisoner—an escape from misdirected emotionalism—as well as, naturally, doing no violence to the feelings of those Christians who are not unreasoningly against all that science stands for and has attained.

INDIAN SCIENCE CONGRESS

FORTY-SECOND SESSION

The forty-second Indian Science Congress was held in Baroda during January 4–10 under the auspices of the Maharajah Sayajirao University of Baroda, and was opened by the Prime Minister of India, Shri Jawaharlal Nehru About five thousand people, including two thousand delegates, attended the session, and there were about sixty guests from countries outside India

At the beginning of the ceremony, Prof S. K. Mitra, president of the session, referred to the sudden death of Sir Shanti Bhatnagar, a past general president and an honorary member of the Indian Science Congress Association, and the audience stood in silence for one minute Welcoming the scientific workers and other visitors to the session, Mrs Hansa Mehta, vice-chancellor of the University of Baroda and chairman of the local reception committee, made an appeal for the application of science in the service of man so that the destructive potentiality of science could be usefully converted for doing good In his short inaugural address, Shri Jawaharlal Nehru exhorted the scientists to co-ordinate activities and render all help in framing the Second National Five-Year Plan for the improvement of the conditions of people The general president of the Association, Prof S K Mitra, emphasized in his address the need for application of modern scientific methods in the industrial sphere with the view of increasing production and making things available to consumers at cheaper prices

The scientific business of the session was carried out in thirteen different sections representing different branches of science, and twenty-nine symposia on different scientific aspects and problems were held. In all, more than a thousand papers were read The following popular lectures were given symmetry in the atomic world (Prof P A M Dirac), on the human value of scientific progress (Prof P Auger), volcanic eruptions (Prof T. Watanabe), relation of science to democracy (W Kaempffert), hæmoglobin (Prof. Linus Pauling), scientific foundation of planning in the U S S R (Academician K V. Ostrovityanov, leader of the U S S R delegation), study of India in the U S S R. (A A. Guber), scientific research in new China (Chien Tuan-Sheng, leader of the delegation of the People's

British Pharmaceutical Codex 1954

The rapid advances in medical and pharmaceutical knowledge have emphasised the need to revise the British Pharmaceutical Codex at frequent intervals

In the present revision nearly one hundred experts have collaborated on committees and subcommittees to provide an authoritative account of the chemical, physical and therapeutic properties of all drugs of importance. The book portrays the major advances that have been made in pharmaceutical chemistry and in the practice of medicine over the past five years.

MACMILLAN BOOKS

Comprehensive Inorganic Chemistry

Edited by M. CANNON SNEED, J. LEWIS MAYNARD and ROBERT C. BRASTED

Volume III—The Halogens, by ROBERT C. BRASTED

Comprehensive Inorganic Chemistry is an eleven-volume reference work on the chemical elements and their inorganic compounds. In this Third Volume the significant advances of recent years are fully reflected in a broad treatment of halogen chemistry. Both basic principles and their applications are exhaustively covered, as well as the new processes, methods of production, and the chemistry of compounds which have lately become so important 35*s.*

Fluid Dynamics of Jets

SHIH-I PAI, Ph D.

University of Maryland

Recent rapid developments in jet- and rocket-propelled missiles and aircraft has led to an increased interest in the nature of the flow field of jets. This book on fluid dynamics, while including a discussion of modern developments, thoroughly covers jet flow from fundamentals to such advanced topics as the laminar flow and the turbulent flow of compressible fluid and properties of turbulence fluctuations 37*s* 6*d.*

Minerals for Atomic Energy

ROBERT D NININGER

United States Atomic Energy Commission

This book, now published in this country for the first time, is sub-titled *A Guide to Exploration for Uranium, Thorium and Beryllium.* It is a complete handbook, covering the geology of these minerals, their incidence in America and elsewhere, their identification, the equipment to use in exploration, etc , and the evaluation of the results of successful searching 55*s*

A Text-book of Electricity and Magnetism

G. R. NOAKES, M A., F.Inst.P

This is the new, Third Edition of a book which will meet the need of those taking Intermediate degree courses and the Advanced and Scholarship Examinations of the General Certificate of Education. All the usual topics required at this stage are dealt with, and where necessary calculus is used. Among the special topics discussed are the conduction of electricity through gases, atomic physics and modern views on ferro- and terrestrial magnetism. *Third Edition.* 14*s.*

RECENT DEVELOPMENTS in virology have emphasized the value of the comparative approach. Advances in one area of virus research often have important implications in others. The literature on virus subjects is widely scattered, mostly in journals which reach workers in only one area, and the desirability of a periodical exclusively devoted to virus science has been suggested by many investigators

The purpose of *Virology* will be to publish articles on the biological, biochemical, and biophysical aspects of the subject, stressing contributions of a fundamental rather than applied nature. It is hoped that the journal will contribute to the integration of virus science by providing a ready introduction to all its fields.

It is planned to publish one volume per year. Volume 1, 1955, will consist of five issues, and will be priced at $9.00 Volume 1, Number 1, is scheduled for release during May 1955.

Manuscripts should be submitted to the Editorial Office, VIROLOGY, 125 East 23 Street, New York 10, N Y., U.S A.

Subscription orders should be sent to

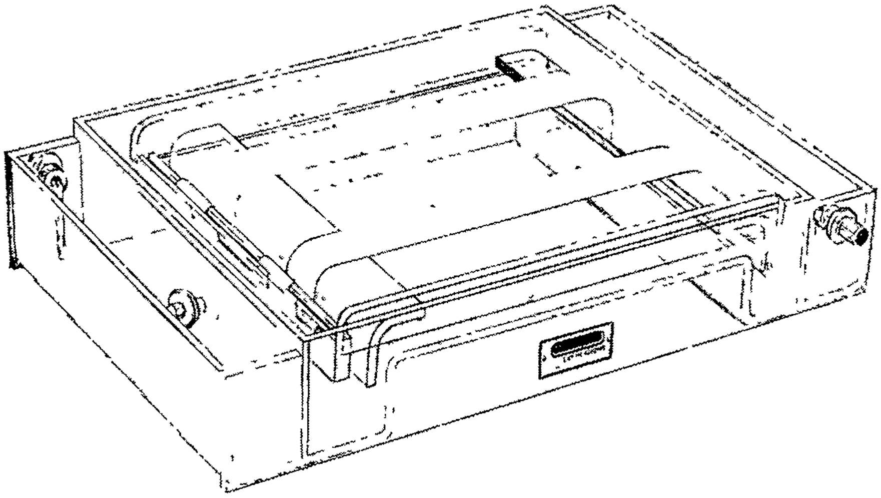
EL CTROPHOR IC TAN

WITH AUTOMATIC PAPER TENSIONER AND PLATINUM-COATED ELECTRODES



This new electrophoresis tank, made entirely from transparent material, has a greatly increased working width of 8 in, so that 3 or 4 strips can be run comfortably at a time

The strips are securely located on a removable bridge and kept under constant tension by a simple device which automatically prevents sagging

The centre of the tank is raised, thus reducing the air space and minimising evaporation Beneath the bottom of the migration chamber crushed ice or other coolants can be conveniently placed for working at lower temperatures

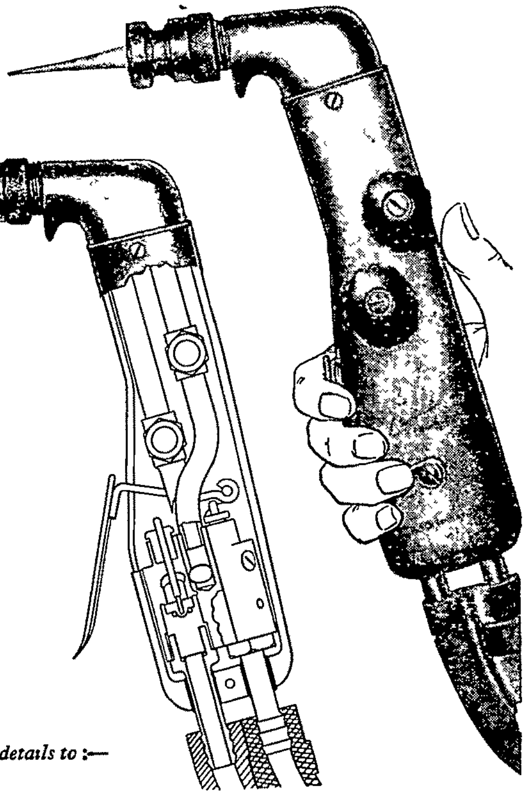
83, London Street, Reading



Where will it turn up next?

The Flamemaster torch turns up in the most unlikely places and among a surprising number of trades Our books show that glass blowers, laboratory technicians, jewellers, dental mechanics and all kinds of metal workers were among the first to welcome this new precision heating tool, and that recently we've had orders from model engineers, electrical engineers, lead-burners and garage mechanics

Why do they all find the Flamemaster so handy ?

Because Installation is extremely simple
Flame control is easy and reliable
Waste is eliminated by our trigger grip economiser
Leaks are impossible.

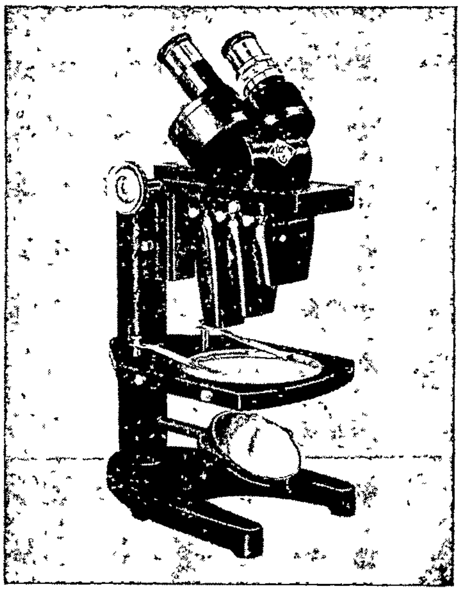
STEREOSCOPIC MICROSCOPES



W. R. PRIOR & CO. LTD.
NORTHGATE END, BISHOP'S STORTFORD
HERTFORDSHIRE

Republic of China), and science and its social relations (Prof. A R. Wadia). Among the special lectures, the following may be mentioned synthesis and stereochemistry of carotenoids (Prof Paul Karrer), metallogenetic provinces and epochs in Japan (Prof T. Watanabe), extensive showers of cosmic rays (Prof P Auger), iron and manganese resources of Japan (Prof T Watanabe), present state of geological education in Japan (Prof T Watanabe), structure of proteins (Prof Linus Pauling), soda ash industry (Dr T P. Hou), and Chinese herbal medicines (Dr Hsieh Yu)

The meetings of the Executive Committee and of the Council of the Indian Science Congress Association were held on January 3 The meeting of the General Committee was held on January 8, at which it was announced that Dr B C Roy was elected as general president for the session 1957, that is, for the year 1956–57 As announced last year, Dr M S Krishnan, director of the Geological Survey of India, will be general president for the year 1955–56 The next session of the Indian Science Congress will be held in Agra in 1956.

THE MASS SPECTROSCOPE

THE handbook, prepared by M G Inghram of the University of Chicago, and R J Hayden of the Argonne National Laboratory, for the Subcommittee on Instruments and Techniques of the Committee on Nuclear Science of the National Research Council*, presents in some detail the fundamental design and operational techniques pertinent to the efficient utilization of the mass spectroscope Attention is directed mainly to the ionic type of mass analyser with either electrical or photographic ionic detection No attempt is made to discuss the wide range of application of mass spectroscopes or to include particulars of the associated electronic circuits, but adequate references to articles on these topics are given

The handbook consists of four sections In the first the equations appropriate to the various types of analysers are stated and explained They relate mainly to instruments with focusing properties A table, in which some seventy different instruments grouped according to type and field arrangement are listed, follows The theories to be applied to all instruments of a given type are similar, and the major differences are largely of constructional detail, some of which, together with the names of the constructors of the instruments and dates of publication, are specified in the table or discussed at length in the text. The second section is devoted to the important problem of suitable ion sources, and the various types are classified according to their primary uses and their sensitivities A table is included showing the compounds appropriate for analysis of each of the elements up to bismuth from gaseous, crucible or surface ionization sources, together with an indication of the preferred source In the third section brief consideration is given to the problems of sample introduction into the ionization region of the mass spectrometer where, unless special precautions are taken, the relative intensity of the ion beams formed by the source will not be characteristic of the sample.

The final section deals with ion detectors, and in addition to the conventional photographic plate and electrometer the use of photomultipliers and scintillation counters is discussed and the design and construction of several types of detectors are outlined and shown schematically

The handbook concludes with a bibliography of more than two hundred references, and though these refer to dates earlier than April 1952 when the manuscript was completed, the report as a whole represents a most valuable source of information on basic principles and procedures of mass spectroscopy

THE GLOBAL RADIATION IN A RAYLEIGH ATMOSPHERE

By DIRAN DEIRMENDJIAN and ZDENEK SEKERA

University of California, Los Angeles, California

THE publication of Chandrasekhar's treatise, "Radiative Transfer"[1], marked an important step in the exact treatment of radiation problems in a scattering medium. One such problem, the complete quantitative description of the radiation field in a scattering atmosphere according to the laws of Rayleigh, was solved as an illustration of the possibilities of the new method. Its success has already been demonstrated by Chandrasekhar and Elbert[2] in explaining the main characteristics of the sky-light polarization observed on clear days

Another application of the method consists of finding the total flux of energy, as a function of the wave-length and direction of the unpolarized light, received at the lower boundary of a plane-parallel scattering atmosphere of finite depth illuminated by parallel radiation of a given flux from a single direction Under certain assumptions, in the case of the terrestrial atmosphere this constitutes what is known as the 'global radiation' It can be shown[3] that the relative global radiation, that is, that arising from an incident flux of unit strength at the corresponding wave-length, can be derived from Chandrasekhar's discussion, in which the independent variables are the optical thickness (defining the wave-length) and the parameter $\mu_0 = \cos \Theta_0$, where Θ_0 is the zenith distance of the sun The resulting expression is a very simple one in terms of the functions γ_l and γ_r, which are identical with those mentioned in equations (7) and (8) of ref 2. We have then

$$G(\tau,\mu_0) = \tfrac{1}{2}\mu_0[\gamma_l(\tau,\mu_0) + \gamma_r(\tau,\mu_0)], \qquad (1)$$

in which $G(\tau,\mu_0)$ represents the relative global radiation, that is, the flux of the sun and sky radiation through a horizontal surface, resulting from the multiple scattering of the incident light The functions $\gamma_l(\tau,\mu_0)$ and $\gamma_r(\tau,\mu_0)$ give the individual contributions of the components of the incident light polarized in directions parallel and normal to the vertical plane through the sun respectively, and their sum,

$$\frac{G(\tau,\mu_0)}{\mu_0} = \tfrac{1}{2}[\gamma_l(\tau,\mu_0) + \gamma_r(\tau,\mu_0)], \qquad (2)$$

is evidently the relative flux through an area normal to the incident parallel unpolarized light The variation of this function with the wave-length and angle of incidence Θ_0 can be appreciated from the curves of Fig 1. These curves are based on values obtained from the fundamental functions X_l, Y_l, X_r and Y_r as defined by Chandrasekhar, which were computed by the IBM system and tabulated in the form of two scientific reports[4,5] (now also available in more detail as computed by S. Chandrasekhar and D D Elbert in *Trans Amer. Phil Soc*, New Series, **44**, Part 6 (1954))

The relative sky radiation is easily found by subtracting from (1) the reduced flux of the direct solar radiation, so that

$$H(\tau,\mu_0) = \tfrac{1}{2}\mu_0[\gamma_l(\tau,\mu_0) + \gamma_r(\tau,\mu_0)] - \mu_0 \exp(-\tau/\mu_0), \quad (3)$$

in which $H(\tau,\mu_0)$ is the sky radiation arising from a unit incident flux and the last term on the right is the reduced flux of parallel radiation coming from the direction $\Theta_0 = \cos^{-1}\mu_0$ Returning to the curves of Fig 1, they appear to be quite regular and their character changes little except for very large values of Θ_0 The curve marked 88 8° is equivalent to local sunset conditions in the sense that the corresponding attenuation in the plane-parallel atmosphere equals that along the finite path in the real atmosphere. The peculiar shape of this particular curve is explained by the fact that at such an oblique incidence the pure sky radiation dominates the direct sunshine in the blue and green part of the spectrum. This is exhibited by the broken-line curve representing the sky radiation H/μ_0 obtained from (3), so that the full curves may also be thought of as representing the sum

$$\frac{G(\tau,\mu_0)}{\mu_0} = \frac{H(\tau,\mu_0)}{\mu_0} + \exp(-\tau/\mu_0). \quad (4)$$

In a discussion of the global radiation, the effect of the earth's planetary reflexion cannot be disregarded. When this is assumed to follow the simplest possible law, namely, Lambert's law, it can be shown[3] that it is sufficient to multiply the expression in (1) by a correction factor

$$\frac{1}{1 - \Lambda\bar{s}(\tau)}, \quad (5)$$

where $\bar{s}(\tau) = 1 - \int_0^1 [\gamma_l(\tau,\mu) + \gamma_r(\tau,\mu)]\mu d\mu$, and Λ represents the albedo of Lambert reflexion. This factor is such that, if, for example, $\Lambda = 0$ 25, it amounts to 1 126 at $\tau = 1$ 00 ($\lambda = 3120$ A. at sea-level) and it approaches unity asymptotically as the optical thickness tends to zero.

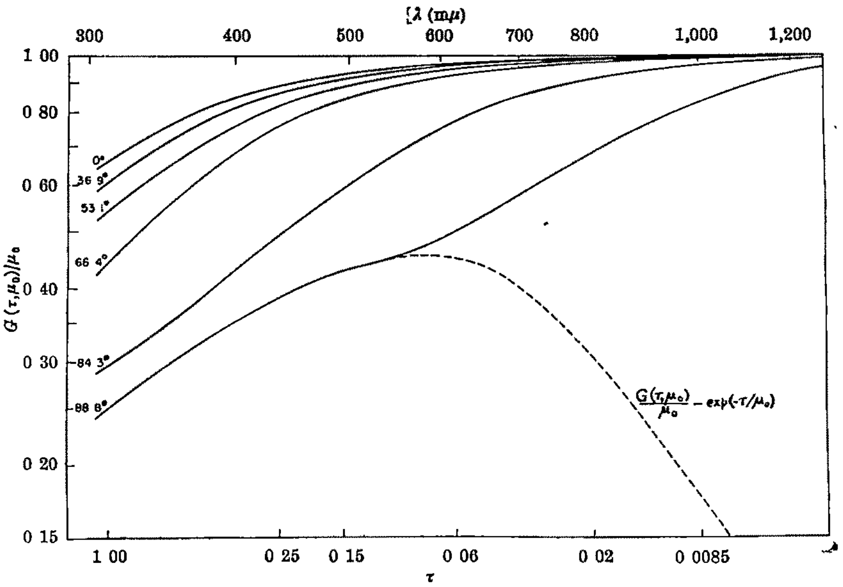

Fig 1 Plots of the global radiation function defined in equation (2) of the text Calculations were made at the values of the optical thickness shown on the bottom scale

If the spectral energy curve representing the fluxes of solar radiation before penetration into the atmosphere is given, it is easy to determine the global radiation at the earth's surface, once the function (1) is known. Its values have been computed in detail and will appear elsewhere[3]. An example of the absolute global radiation obtained in this way is shown in the diagram of Fig 2, in which the solar energy distribution given by Nicolet[6] was used (uppermost curve marked $\pi F_{0\lambda}$) The top of the thick curve in each case gives the global radiation including Lambert reflexion with an albedo of 0 25. The situation for three different solar zenith distances is shown, corresponding to 0°, 53 1° and 84 3°, respectively. It is interesting to note that the global radiation with the sun at 53 1° from the zenith should not be much different in spectral distribution from the global radiation for an overhead sun, though the amount of radiation is considerably less in the former case The inked-in areas in Fig. 2 represent the contribution from terrestrial reflexion with an

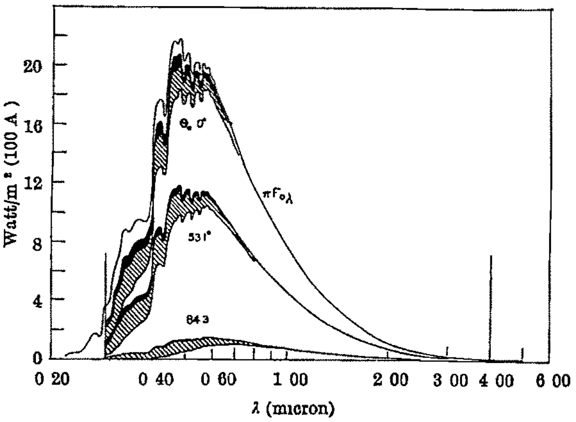

Fig 2 Global radiation according to the extended Rayleigh theory at various solar zenith distances (Θ_0), in the case when the solar energy before entering the atmosphere is given by the top curve marked $\pi F_{0\lambda}$

albedo of 0 25, and the hatched areas the pure sky radiation component

This pure sky radiation is shown separately in Fig. 3, in which the vertical scale has been expanded for greater clarity. The curves here represent the energy originating from the whole sky and received by a horizontal area at sea-level in watts per square metre and per 100 A interval centred at the wave-length of the corresponding ordinate. The exact character of the blue Rayleigh sky-light can be appreciated for the first time, in a way that includes the effects of all orders of scattering An interesting feature is that the maximum of this sky-light shifts towards the green when the sun is close to the horizon. The broken-line curve in Fig. 3 stands for the sky radiation when the earth is reflecting according to Lambert's law with an albedo of 0 25 and the sun occupies the local zenith, at which time the reflexion correction assumes its maximum value

Finally the integrated global radiation (for example, what would be measured by an instrument like the Eppley pyrheliometer) and the integrated sky radiation are given by the areas under the curves of Figs. 2 and 3, respectively. If the integration is done between wave-lengths 0 29 μ and 4 00 μ with an extra-terrestrial energy amounting to 1390 55 watts per square metre according to Nicolet's curve, the corresponding integrated global and sky radiation would be

	$\Theta_0 = 0°$	53 1°	84 3°
Global radiation			
No earth reflexion	1330 7	779 5	110 5 watts/m ^{2}
With reflexion albedo 0 25	1352 1	791 5	112 3 „
Sky radiation only			
No earth reflexion	57 0	50 9	23 8 „
With reflexion, albedo 0 25	78 4	62 9	25 6 „

The above values check fairly well with actual results obtained under clear sky conditions, however, a real check of the theory must await more detailed measurements giving the spectral distribution of the global and sky radiation. It is to be expected that this quantity will differ from the Rayleigh values according to the amount and properties of the atmospheric particles which scatter light according to a law different from Rayleigh's law. [Oct. 4

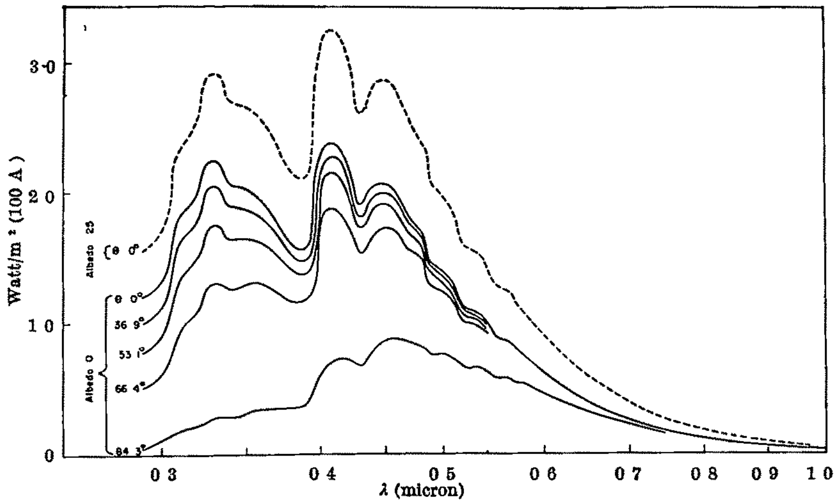

Fig 3 Pure sky radiation under the same assumptions as for Fig 2 Note the change in the vertical scale The broken-line curve represents the sky radiation under an overhead sun, after it has been corrected for Lambert reflexion with an albedo of 0 25

PITUITARY AND ADRENAL INFLUENCES ON THE COMPOSITION OF LIVER CYTOPLASM

By Dr. E REID

Chester Beatty Research Institute, Institute of Cancer Research, Royal Cancer Hospital, London, S W 3

HORMONAL influences on liver composition, as revealed by differential centrifugation[1], have so far received no attention comparable with that given to cancerous changes in liver Nucleic acid analyses performed on whole liver, particularly in the laboratories of Li[2] and of Di Stefano[3] (as reviewed elsewhere[4]), have shown that, after adrenalectomy or hypophysectomy, ribonucleic acid diminishes, either in absolute amount or at least relative to deoxyribonucleic acid, and that growth hormone can reverse this effect of hypophysectomy The intracellular site of these changes has now been investigated

The investigation was carried out with albino rats, arranged in groups such that experimental rats could be compared with control rats (intact or sham-operated) which had received the same amount of food and which were killed on the same day, a procedure adopted to minimize variability due to any day-to-day variations in technique or conditions The effect of hypophysectomy was studied in males of about 200 gm weight, some of which received growth hormone (0 3 mgm./day for eight to twelve days). The controls included not only pair-fed rats but also some rats fed *ad libitum* The effect of adrenalectomy was studied in females of about 250 gm weight, some of which received injections of cortisone acetate (2 mgm /day for six to eight days), saline was given in place of drinking water.

After a post-operative period of two to three weeks and following an overnight fast, the rats in each group were anaesthetized with 'Nembutal', and the liver perfused *in situ* with cold 0 25 *M* sucrose solution, as afterwards used for the differential centrifugation[1]. A minced sample of liver was homogenized in a Potter-type homogenizer, and the homogenate centrifuged to remove 'debris' containing the

Table 1. YIELDS (gm. per 100 gm. BODY-WEIGHT) OF LIVER FRACTIONS

Fraction	Control rats (mean value)	Experimental rats (values as per cent of values for control rats)*			
		Hypophysectomized	Hypophysectomized + growth hormone	Adrenalectomized	Adrenalectomized + cortisone
Whole liver (wet weight)	3.36	108.2 ± 2.7 (n = 20, P < 1%)	129.9 ± 8.4 (n = 11, P < 2.5%)	100.6 ± 3.3 (n = 20)	122.6 ± 2.8 (n = 8, P < 0.1%)
Mitochondrial fraction	0.164	85.9 ± 5.7 (n = 17, P < 2.5%)	118.4 ± 14.0 (n = 12)	83.7 ± 3.6 (n = 18, P < 0.1%)	128.0 ± 5.6 (n = 7, P < 0.5 %)
Microsome fraction	0.140	124.7 ± 6.4 (n = 17, P < 0.5%)	131.3 ± 12.0 (n = 12, P < 2.5%)	93.0 ± 4.4 (n = 18)	115.9 ± 11.4 (n = 8)
Supernatant fraction	0.350	108.4 ± 7.6 (n = 11)	120.8 ± 10.4 (n = 11)	99.0 ± 5.6 (n = 17)	164.5 ± 21.3 (n = 7, P < 2.5%)
Ultracentrifugal fraction from supernatant	0.065	156.0 ± 19.0 (n = 4)	107.4 ± 6.3 (n = 7)	116.4 ± 7.9 (n = 10)	145.4 ± 16.7 (n = 5)

* Mean ± standard error; n denotes number of observations and P the probability that the difference from the controls could be due to chance.

nuclei. Centrifugation was performed with an 'Angle 13' centrifuge (Measuring and Scientific Instrument Co.). The debris was homogenized and centrifuged twice more, and the combined supernatants further centrifuged (for 20 min., 12,000 g at extreme tip of tube) to sediment the 'large-particle' (mitochondrial) fraction, which was washed once. Further centrifugation, 20,000 g for 90 min., gave a microsome fraction, which showed a clear morphological difference from the mitochondrial fraction on electron micrographs (kindly prepared by Mr. F. W. Cuckow). The final supernatant fraction was, in some experiments, further centrifuged (90 min. at 145,000 g) to give an 'ultracentrifugal fraction'. Each fraction was freed from sucrose by dialysis in the cold, against water containing a trace of ammonium carbonate to maintain the pH slightly alkaline[5], and was freeze-dried on the following day.

As shown in Table 1, there was an increase in relative liver-weight in hypophysectomized rats, whether untreated or injected with growth hormone, in contrast with the decrease reported from Li's laboratory[2]. If the hypophysectomized rats were compared only with the controls fed *ad libitum*, no difference in liver-weight was evident. Comparisons in other respects showed no differences between controls fed *ad libitum* and pair-fed controls, which were therefore regarded as equivalent.

An increase in liver-weight also occurred in adrenalectomized rats given cortisone, although not in untreated adrenalectomized rats.

Hypophysectomy, with or without growth hormone, led to an increase in the yield of the freeze-dried microsome fraction; the same tendency was shown by the other cytoplasmic fractions, with the notable exception of the mitochondrial fraction, the yield of which was significantly depressed in the untreated hypophysectomized rats. A similar depression of mitochondrial yield was found with adrenalectomized rats, although not if cortisone had been given. Cortisone had the further effect of markedly elevating the yield of the supernatant fraction; this increase was not confined to the ultracentrifugal fraction.

Portions of each cytoplasmic fraction were treated with cold trichloracetic acid solution and then with lipid solvents, and the lipid extracts and residues separately analysed for total phosphorus. It is essentially valid to regard the residual phosphorus as entirely derived from ribonucleic acid. The results thus obtained (Table 2) show only one change in lipid phosphorus concentration—a fall in the case of the microsome fraction from hypophysectomized rats given growth hormone. But decreases in concentration of ribonucleic acid phosphorus are found with hypophysectomized rats in the case of both the mitochondrial and the microsome fractions, the fa in microsome ribonucleic acid phosphorus bein actually enhanced by growth hormone. On the othe hand, an increased concentration of ribonucleic aci phosphorus is found in the supernatant fraction (no primarily in the ultracentrifugal fraction derive therefrom) both with hypophysectomized rats give growth hormone and with adrenalectomized rats.

With the view of obtaining aqueous solutions o cytoplasmic proteins suitable for electrophoreti studies, samples of the cytoplasmic fractions othe than the supernatant fraction were treated wit n-butanol[6] and then with borate buffer. Crud comparisons of the protein patterns obtained afte paper electrophoresis showed no consistent hormona effects; but some interesting hormonal effects wer revealed by weighing the residue remaining after eac extraction. With the hypophysectomized rats give growth hormone, the residue from the butanol extrac tion was lowered in the case of the microsome an ultracentrifugal fractions, thus suggesting that th lipid content of these fractions was increased. Wit untreated hypophysectomized rats, the residu remaining after the further aqueous extraction (Tabl 2) was increased in the case of the mitochondria fraction but was lowered in the case of the microsom fraction. The values for hypophysectomized rat given growth hormone were lower, for all fraction studied (Table 2), than those for untreated hypophys ectomized rats, while adrenalectomy was withou significant effect.

Clearly, then, pituitary and adrenal hormone influence the yield and composition of the fraction derived from liver cytoplasm. Equivalent change have not been observed in the yields of the corre-sponding fractions from kidney, nor have intac female rats given growth hormone shown change such as occur in the liver of hypophysectomized rat given growth hormone. The fall in mitochondria yield after hypophysectomy might be attributable t loss of adrenocorticotrophin together with growt hormone, since adrenalectomy likewise depresses th yield. Recalculation of ribonucleic acid phosphoru in terms of body-weight shows a striking depression in untreated hypophysectomized rats in the case o the mitochondrial fraction, although not of the othe fractions, and also a significant depression in hypo-physectomized rats given growth hormone, in the case of the microsome fraction. On the other hand, the ribonucleic acid phosphorus of the supernatant is increased in hypophysectomized rats given growth hormone and in adrenalectomized rats; the lack of change in untreated hypophysectomized rats suggests that both adrenocorticotrophin and growth hormone influence, in converse directions, the ribonucleic acid

Table 2. COMPOSITION (mgm./100 mgm. FREEZE-DRIED FRACTION) OF LIVER FRACTIONS

Fraction	Constituent	Control rats (mean value)	Experimental rats (values as per cent of values for control rats)			
			Hypophysectomized	Hypophysectomized + growth hormone	Adrenalectomized	Adrenalectomized + cortisone
Mitochondrial fraction	Lipid phosphorus	0.63	105.2 ± 3.5 ($n = 17$)	99.9 ± 2.8 ($n = 13$)	93 ($n = 2$)	—
	Ribonucleic acid phosphorus	0.48	90.0 ± 4.6 ($n = 16$, $P < 5\%$)	89.9 ± 5.6 ($n = 11$)	115.0 ± 7.9 ($n = 5$)	90 ($n = 3$)

Microsome fractions	Lipid phosphorus	0.88	92.7 ± 6.1 ($n = 18$)	84.9 ± 4.0 ($n = 15$, $P < 0.5\%$)	93 ($n = 2$)	—
	Ribonucleic acid phosphorus	0.65	86.4 ± 4.7 ($n = 16$, $P < 2.5\%$)	72.1 ± 6.1 ($n = 15$, $P < 0.1\%$)	115.8 ± 13.1 ($n = 4$)	101 ($n = 3$)
	Non-extractable material	48	89.3 ± 4.2 ($n = 17$, $P < 2.5\%$)	75.0 ± 4.9 ($n = 12$, $P < 0.1\%$)	99.0 ± 6.1 ($n = 7$)	—
Supernatant fraction	Lipid phosphorus	0.166	112.6 ± 6.9 ($n = 10$)	118.3 ± 14.9 ($n = 7$)	93 ($n = 3$)	—
	Ribonucleic acid phosphorus	0.223	105.5 ± 5.3 ($n = 12$)	141.0 ± 10.6 ($n = 10$, $P < 0.5\%$)	124.5 ± 5.9 ($n = 6$, $P < 1\%$)	125 ($n = 3$)
Ultracentrifugal fraction from supernatant	Lipid phosphorus	0.68	125.5 ± 11.6 ($n = 4$)	107.1 ± 11.2 ($n = 6$)	—	—
	Ribonucleic acid phosphorus	0.67	90.8 ± 7.8 ($n = 4$)	113.7 ± 6.8 ($n = 6$)	87 ($n = 1$)	87 ($n = 1$)
	Non-extractable material	45	99.8 ± 6.8 ($n = 4$)	76.3 ± 6.1 ($n = 6$, $P < 2.5\%$)	—	—

* Insoluble after extraction at room temperature with *n*-butanol and then with borate buffer (*p*H 9.2).

phosphorus of the supernatant. It is, however, paradoxical that administration of cortisone to adrenalectomized rats did not reduce the yield or ribonucleic acid phosphorus content of the supernatant fraction; the yield was actually increased by cortisone. Lowe and Williams[7] observed a striking shift of ribonucleic acid from the mitochondrial and microsome fractions to the supernatant fraction, and especially to the ultracentrifugal fraction, on giving cortisone to intact rats. Since, however, cortisone was given at the enormous dosage of 25 mgm. a day, their results may have little bearing on those now obtained. But an analogous rise of the ribonucleic acid in the supernatant fraction has been observed with rat liver following hypoxia or shock[8].

The decreased extractability of the mitochondrial fraction in untreated hypophysectomized rats could be due merely to lack of growth hormone; but in the case of the microsome fraction, if not of the ultracentrifugal fraction, it appears that the change in extractability cannot be explained merely in terms of growth hormone alone or of growth hormone together with adrenocorticotrophin. The same conclusion arises from the finding[9] that the number of particles in the mitochondrial fraction is not significantly altered by hypophysectomy alone or by adrenalectomy, but is increased in hypophysectomized rats given growth hormone.

If the growth-hormone treatment indeed enhanced protein synthesis in the liver, one might have predicted a rise rather than a fall in microsome ribonucleic acid, for it is currently believed that protein synthesis occurs particularly in the microsomes and is linked in some way with ribonucleic acid[10,11]. It is possibly relevant that microsome protein synthesis is favoured by the presence of non-dialysable material[10] which might, under the present conditions, remain unsedimented. There is, of course, the possibility that ribonucleic acid could escape from mitochondria or microsomes during their isolation in consequence of an increase in permeability, and thus appear in the supernatant fraction.

In extending this preliminary investigation, it will be desirable to employ more refined centrifugation procedures. There is now ample evidence in the literature that mitochondrial and microsome fractions as now prepared are quite heterogeneous; thus, the 'mitochondrial' ribonucleic acid is located largely in particles composing the so-called fluffy layer. Another aspect which warrants attention is the effect of hormones on the turnover-rate of the ribonucleic acid in the different cytoplasmic fractions and also of nuclear ribonucleic acid, the amount of which is apparently influenced, in common with that of cytoplasmic ribonucleic acid, by hypophysectomy and by growth hormone[3].

Added in proof. When liver fractions are made extractable by treatment of cytoplasmic preparations with *n*-butanol in aqueous medium as recently described[12] rather than in the dry state, labile proteins may become denatured.

Acknowledgment is made to the British Empire Cancer Campaign for the award of a Junior Fellowship, to Prof. Alex Haddow for general encouragement, to Mr. I. Martin for technical assistance, to Dr. S. L. Steelman (of Armour and Co., Chicago) for providing growth hormone, and to Sir John Taylor (of the Medical Research Council) for providing cortisone acetate. Financial support was derived from grants to the Royal Cancer Hospital and Chester Beatty Research Institute from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, U.S. Public Health Service.

Age Measurements on a Pegmatitic Mica from the Rhodesian Shield

IN the course of a series of determinations by the rubidium-87 → strontium-87 method of the ages of pegmatitic micas, it has been found that the method of separating and sampling such materials involves a possible source of error which we feel should be known to workers in this field and to those who prepare and select material for them. The effect is illustrated by measurements on a lepidolite from Pope's Claim, near Salisbury, Southern Rhodesia, of which the hand sample consists of a roughly elliptical 'book' of mica with axes 6 in. and 4 in and 1½ in thick The book contains three sharply differentiated types of mica (*a*) purple biaxial ($2V \approx 30°$), (*b*) greenish-white biaxial ($2V \approx 40°$) and (*c*) purple uniaxial The uniaxial mica lies between the two biaxial forms and in two isolated patches at the edge of the hand sample. The boundaries between the micas are perpendicular to the plane of the mica sheets and penetrate the full thickness of the book

Subsamples from the three zones, after the rejection of a few outer sheets, were weighed and dissolved in hydrofluoric acid and perchloric acid and made up as standard solutions of 100 c c in approximately $3N$ hydrochloric acid The concentrations of rubidium-87 and radiogenic strontium-87 were then determined by solid-source mass-spectrometric measurements on aliquot portions of these solutions using isotope dilution techniques The mass spectrometer resolution was in all cases around 200 The methods of separation of rubidium and strontium were based on those described by Aldrich *et al* [1] and will be described in detail elsewhere Care was taken to avoid contamination and to obtain the highest accuracy from the isotope dilution method.

The concentrations of rubidium-87 and radiogenic strontium-87 found in the three types of mica are given in Table 1 and show a wide variation The ages found from them are, however, all in satisfactory agreement and confirm the great age previously found by this method and others for the Rhodesian Shield

It is clear that if the necessary four determinations of the rubidium-87 and radiogenic strontium-87 contents and isotopic abundances of this material had not been made on the same separated subsamples of *a*, *b* and *c* the age results might have been very much in error Even crushed and well-mixed samples of the 'book' as a whole would have to be quite homogeneous to ensure that no great spread occurred in the results The errors expressed in these ages have been evaluated so as to give the maximum range of the determinations made On other rocks there ar indications of the need for a full statistical examination before a true significance can be attached t individual ages, and this study is now in progress

Table 1 HAND SAMPLE FROM POPE'S CLAIM, NEAR SALISBURY, SOUTHERN RHODESIA

Mica	$\left(\frac{^{87}\text{Sr}}{\text{Total Sr}}\right)$rock	$^{87}\text{Rb}_0$ (mgm / gm)	$^{87}\text{Sr}^*$ (μgm / gm)	Age in years $\times 10^{-9}$
(*a*) Purple biaxial	0 952	8 99	266	$2\ 69^{+0\ 115}_{-0\ 061}$
(*b*) Green biaxial	0 713	4 77	148	$2\ 82^{+0\ 053}_{-0\ 118}$
(*c*) Purple uniaxial	0 986	7 12	201	2 57

We should also like to direct attention to a poin of importance in the use of isotope dilution methods Any small error, whether due to contamination or t measurement, may be reflected as a large error i the derived age if the relative amounts of rock an added isotopic diluent are not carefully chosen. Th choice will depend upon the isotopic abundances i the rock and added diluent, and the particular isotopi ratios chosen for finding the concentrations

Finally, it may be pointed out that the results i Table 1 show that if ionic migration has taken plac in this material, it has been such as to preserve th same ratio of rubidium-87 to radiogenic strontiu in all three zones, which seems unlikely

We wish to thank Dr M. A. Tuve and Dr L. T Aldrich, of the Department of Terrestrial Magnetism Carnegie Institution of Washington, for help in th initiation of our programme of work in this field

Origin of Nickel in Deep-Sea Sediments

Pettersson and Rotschi[1] have suggested tha cosmic dust may be in part the source of the nicke found in Pacific deep-sea cores. In these cores nicke occurs in amounts up to 0 08 per cent, and it wa stressed that this is considerably higher than th average value of 0 008 per cent given by Sandel and Goldich[2] for the uppermost crust of the earth Öpik[3] concurred with the view that the nickel i largely of cosmic origin, and concluded that th "zodiacal light as interpreted by van de Hulst[4], an the cosmic nickel revealed by the Swedish Deep-Se Expedition are produced mainly by primordial dus of the solar system spiralling towards the sun i orbits which are nearly circular". Buddhue[5] estimate from the amounts of cosmic dust brought down b rain that the annual fall of magnetic particles ove the earth's surface is 35–70 × 10^6 kgm., while Norri and Hogg[6], from the weight of magnetic particle falling on trays exposed in north-west Canada, stat that the annual fall per square kilometre amount to less than half a kilogram. Support[3] for a cosmi origin of nickel was also given by the similarit between van de Hulst's figure for the space densit of the zodiacal light cloud of primordial dust an that required to account for the nickel content o deep-sea clays

Pettersson and Rotschi were careful to point ou that confirmation of meteoritic origin of the nicke in deep-sea sediments was necessary, and suggeste that this might be obtained if an analysis for th platinum metals could be made in these sediments

Although we have detected palladium, using a radioactivation method, even in some Atlanti globigerina ooze samples, its presence does not i

Table 1 RATIOS INVOLVING NICKEL, COBALT AND COPPER

Material	Number of samples examined	Ni Co Average ratio	Ni Co Range	Ni Cu Average ratio	Ni Cu Range	Cu Co Average ratio	Cu Co Range
Red clay	11	3 1	1 6–7 1	0 85	0 4–1 3	3 7	1 3–5 7
Globigerina ooze	33	4 1	1 8–7 0	0 77	0 4–1 6	5 4	2 0–11 0
Manganese nodules	7	4 3	1 4–6 5	1 2	0 4–2 4	4 3	0 6–7 0
Oceanic rocks	9	2 3	1 4–4 3	1 6	0 2–3 1	2 7	0 7–6 9
Average for igneous rocks (ref 7)		3 5		1 1		3 0	
Meteorites (stones and stony-irons)	9	22 7	12–52	100	75–119*	0 24	0 2–0 4*
Average for meteorites (ref 7)		13 1		92		0 14	

* Omitting Khor Temiki, which gave Ni Cu 11 7 and Cu Co 2 0

our opinion confirm the meteoritic origin of the nickel, as the ratio nickel to palladium is approximately the same ($\sim 10^4$) for both average meteorites and igneous rocks[7]. (*Added in proof.* Similar reasoning has been applied in the case of manganese nodules[8].) Much more pertinent ratios for information about meteoritic origin would seem to be those of nickel/cobalt, nickel/copper and copper/cobalt, which are given as 13 1, 92 and 0 14 for meteorites, and 3 5, 1 1 and 3 0 for igneous rocks respectively[7].

We have determined these three elements, by radioactivation methods, in representative samples of globigerina ooze, red clay and oceanic rocks from the Atlantic, Pacific and Indian Oceans, and the average ratios with their range are given in Table 1 Some further analyses of manganese nodules and stony meteorites, using the same methods, are included. Although in one batch of globigerina ooze samples from a short pilot core there seemed to be a possible significance in that the nickel/cobalt ratio increased with increasing nickel content (the other two ratios did not change significantly), the many further samples of globigerina ooze and red clay did not show any such correlation

From this fact and the evidence given in Table 1, it would appear that there is little significant contribution of meteoritic material to deep-sea sediments, unless some remarkable differential behaviour of the three elements nickel, cobalt and copper has taken place.

Acknowledgment is made to Mr. A J. Wood and Mr. D. Mapper for their invaluable assistance in the analyses. Details of this work will be submitted for publication elsewhere.

Snowfall and Temperature on a California Mountain

A SNOWFALL and temperature analysis has been ompleted for six winter seasons (1948–54) on White Mountain, California (elevation 10,600 ft.). Snowfall and the temperature maxima and minima were measured for every 24 hr. at 0800 Pacific Standard Time. Fig. 1*a* shows the total snowfall as a function of the mean air temperature of the day on which the snow fell An interesting peak occurs at – 11° C., just as Bossolasco reports[1] for the case of snowfall at Weissfluhjoch. Rau's laboratory work[2] indicates that the majority of atmospheric nuclei induce freezing between – 10° and – 12° C Silver iodide begins its activity as a freezing nucleus in the laboratory at – 4° C. [3], and at this point Fig. 1*a* shows another peak. Bossolasco has also mentioned that Mason and Ludlam[4] report this point as a secondary maximum in laboratory frequency of atmospheric freezing nuclei. However, it is believed that the – 4° C. peak may be related to large cloud-seeding experiments utilizing silver iodide smoke carried on in the Sierra Nevada Mountains about thirty miles up wind to the west[5] during the seasons 1951, 1952 and 1953 Vonnegut[6] expected that unusual and far-reaching effects must be expected in the case of such seedings, since silver iodide is much more active than any known natural ice nucleus.

In considering the first three winters alone, we find no significant peaks at temperatures warmer than – 11° C. Carbon dioxide ('dry ice') seeding was being carried on in the area during these winters[7]. In a plot of the frequency of snowfall (when amounts were 0 10 in. or more) as a function of mean air temperature (see Fig 1*b*) the same two peaks of Fig. 1*a* appear, with the – 4° C. maximum depending entirely on the second half of the six-season period There is no peak in this latter region for the first three winters

I am indebted to the University of California for the weather observations and to the Office of Naval

Newtonian Cosmology

THE late E. A Milne[1] found a Newtonian analogue of a particular relativistic model of the expanding universe He and I then showed[2] that there are Newtonian analogues of all the pressure-free relativistic models and, moreover, that the equations describing their behaviour are formally identical with the relativistic equations As we stated, there are differences regarding the interpretation of the equations However, our view that the work helps in the physical understanding of the relativistic treatment has been borne out by subsequent developments D Layzer[3] has recently criticized our work and asserts that "it is incompatible with the Newtonian conception of gravitation which it tries to incorporate". H. Bondi[4] regards it as not strictly compatible with Newtonian dynamics, but he gives reasons for the results being nevertheless significant

The fact is that our work is rigorously in accordance with classical kinematics, dynamics and gravitation, when it is correctly formulated. The reasons may be briefly stated here (and will be given more fully elsewhere)

Let F be a Newtonian frame of reference, t Newtonian time, R a function of t only Let there be given a finite distribution of pressure-free, gravitating fluid S, spherically symmetric about a point O fixed in F Then the work of Milne and myself shows that the following behaviour of S is possible on strictly classical theory

Velocity of a particle P having position vector $\mathbf{q}$ in F relative to O as origin is.

$$d\mathbf{q}/dt = (R'/R)\mathbf{q}, \quad (R' \equiv dR/dt) \tag{1}$$

the motion being therefore radially symmetrical with respect to O, the density ρ is a function of t only, given by

$$\rho = \rho_0/R^3, \quad (\rho_0 = \text{constant}) \tag{2}$$

the density being therefore uniform at each epoch, the function R is any solution of the equation

$$R^2R'' = -\frac{4}{3}\pi G\rho_0, \quad (G = \text{gravitational constant}) \tag{3}$$

the function R being therefore independent of the overall extent of the fluid

Suppose, then, that the system is behaving in this way, R being any particular solution of (3). Its behaviour is therefore once and for all in strict accordance with classical theory

Now let A be any given particle of the fluid wit position vector $\mathbf{a}$ relative to O Let G be a referenc frame in which A is fixed, G being not rotating rela tive to A. Let $\mathbf{q}_A$ be the position vector of P in relative to A as origin. Then (1), with its particula case $d\mathbf{a}/dt = (R'/R)\mathbf{a}$ and the vector relation $\mathbf{q}_A =$ $\mathbf{q} - \mathbf{a}$, gives

$$d\mathbf{q}_A/dt = (R'/R)\mathbf{q}_A \qquad (4$$

Thus the motion of the fluid in G relative to A the same as its motion in F relative to O. Th depends upon classical kinematics only, and no upon assuming the frame G to be Newtonian, G not Newtonian.

The boundary of the fluid is not symmetrical abou A But we have seen that the motion of the flu is independent of its extent This we can take to b arbitrarily great and, in particular, large compare with the range of observation of any observer sup posed moving with the fluid. Using his own referenc frame, every such observer will then give exactl the same description of 'the universe' at the sam epoch t Or, rather, this is true save for observe relatively close to the boundary of the system; th proportion of these exceptional observers can be mad arbitrarily small by taking the extent of the syste sufficiently large.

We could let the extent of the system tend t infinity and then apparently obtain the equivalenc as applying to all observers moving with the fluid This is, in effect, what Milne and I did But it not a meaningful 'limit' It is, however, complete adequate for our purpose, and mathematically prefe able, to keep to an arbitrarily large system. Fo then there is no question of departing from a stric Newtonian treatment

As we showed, equations (2) and (3) lead to result formally identical with those of relativistic cosmolog and having the same degree of generality. Therefor if we seek the Newtonian analogue of the gener relativistic model, it exists, it is the system we con template, and, as the present discussion shows, it strictly Newtonian. The validity of this result is th concern of this communication, the interest or valu of the result need not be considered here

Layzer considers the work to be invalid because h fails to get the same result by a different mathematic treatment applied to a different system. Of th system, he affirms that the density is uniform a any epoch and the gravitational intensity vanishe everywhere. Consequently, it is not a Newtonia system unless the density is zero The impossibilit of getting a Newtonian system by such a procedur is well known, what Milne and I did was expressl to find a different procedure.

It must be added that, from some work of Bondi's Layzer[3] also infers a property of Einstein's law gravitation that seems to substantiate Milne's an my interpretation However, so far as a 'Newtonia treatment of an unbounded system is concerne Layzer has directed attention to a genuine difficulty

Infection of Wheat by Loose Smut, *Ustilago tritici* (Pers.) Rostr.

THE life-history of this disease was first investigated at the beginning of this century[1], and it has been generally accepted that infection takes place through the stigmas at flowering time. A few workers[2] considered, however, that the fungus may also penetrate directly through the ovary wall. In 1934 [3] this latter phenomenon was actually reported, and in 1942 [4] infection both down the style and through the ovary wall was said to occur. Very little appears to have been published on the path of the fungus from the nside of the ovary wall to infection of the embryo proper since it was first described by Lang[1].

In 1953 and 1954, ears of susceptible wheat varieties (Hybrid 46, Vilmorin 27) were inoculated at anthesis by the partial vacuum method[6]. Ears were then fixed at intervals after inoculation and the path of infection investigated. Surface preparations of the various issues of the developing grain and serial microtome sections were used. More than sixty grains were examined by one or other method.

No evidence of infection down he style has been found; mycelium was never present at he apex of the grain in the tylar area. Entry of the fungus nto the ovary was found to take lace through the ovary wall pericarp). Penetration of any art of the wall seems to be ossible. Most frequently it was een on the shoulders of the rain just below the lowest of the airs which abound at the apex f the grain.

An appressorium was formed t the point of penetration, and he usual peg-like structure was resent at the point of entry. Funnels and sheathing of internal mycelium (Fig. 1) were often een[7]. In the pericarp, the mycelium was mainly intracellular. After about ten days, he fungus had reached the testa rea and begun to permeate his region, where it was again hiefly intracellular. Mycelium as rarely found in the endosperm, and even where present extended only to the depth f a few cells. Over the embryo dorsal side of the grain) the ycelium grew from the testa hrough the aleurone layer and ntered the scutellum (Fig. 2). his stage was reached after bout thirty days. The mycelium developed profusely in he scutellum and passed to the embryo proper, but did not penetrate the plumule or radicle.

Infection of the scutellum and embryo from mycelium present on the ventral side of the grain has not been seen (cf. ref. 5).

In July 1954 ears were picked at random in a farm crop of badly infected Hybrid 46 wheat in Sussex and fixed. Examination of a number of grains has shown that spores were frequently present on the wall of the developing grain, and mycelium and penetration points were present on the pericarp of each grain having an infected embryo. The testa also of infected grains contained mycelium.

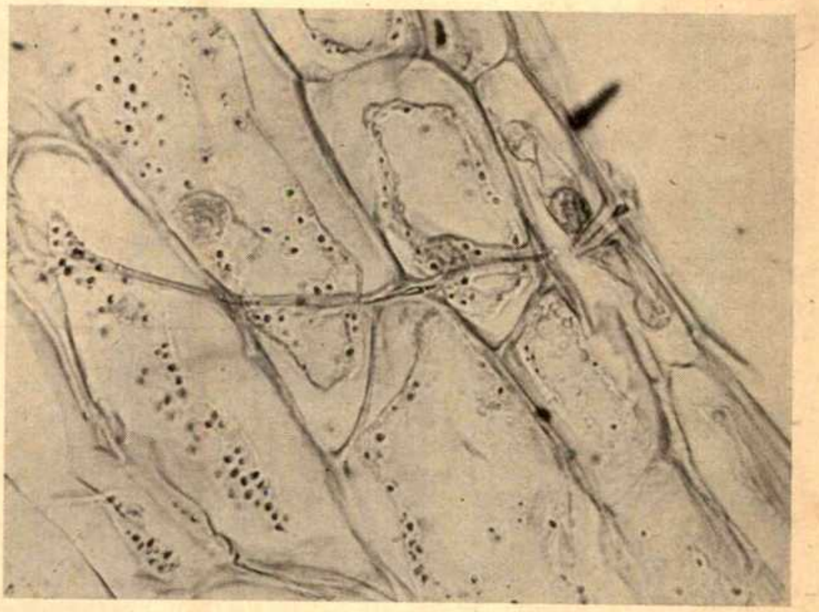

Fig. 1. Longitudinal section of pericarp of developing wheat grain 18 days after inoculation, showing funnel at point of entry and sheathing of the intracellular mycelium. × 675

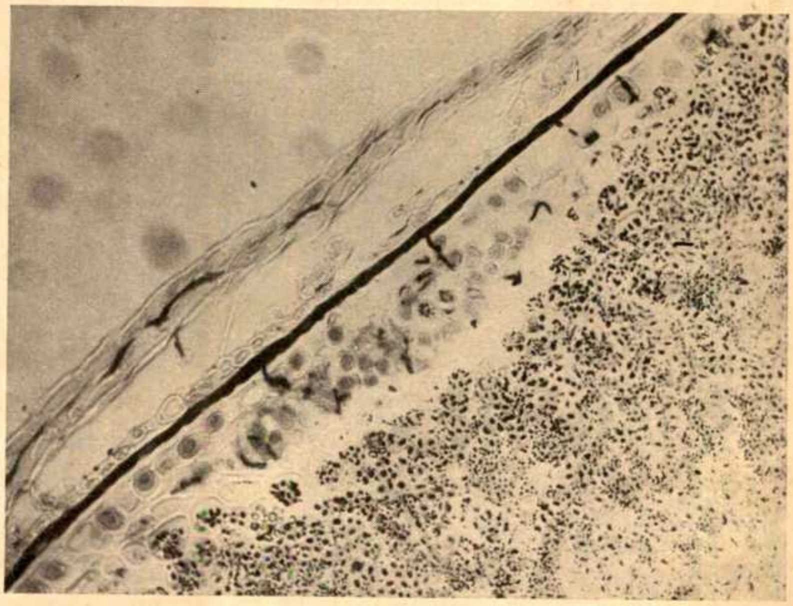

Fig. 2. Longitudinal section of developing wheat grain near edge of scutellum showing mycelium entering scutellum from testa, 33 days after inoculation. × 560

A full account of these observations will appear elsewhere.

Campestrin, the Antibiotic of *Psalliota campestris*

Atkinson[1] has obtained an antibiotic from *Psalliota xanthoderma* which she has recently named 'psalliotin'. In 1946 and 1949 she gave an account of the potency of this antibiotic substance against Gram-negative and some Gram-positive bacteria. So far, the substance awaits purification. She advocates darkness or yellow light during the extraction process, as she has found that the antibiotic substance in crude form is very sensitive to different types of light.

In 1952 and 1953 I published[2] a somewhat detailed account of the antibacterial action of *Psalliota campestris* (L.) Fries, the common edible mushroom. This is readily available in Calcutta markets during the rainy season. *Psalliota xanthoderma* is also edible; but it is regarded as somewhat poisonous and toxic to some persons according to the publication of the Ministry of Agriculture and Fisheries, Great Britain, where it is recorded as: "it is suspicious in character and is known to have caused illness in some cases". Elaborate animal experiments showed that the crude filtrate of *Psalliota campestris* is completely non-toxic. Clinical trials in typhoid cases in the Carmichael Medical College Hospital gave encouraging results. Partial concentration of this crude filtrate was carried out by absorption on activated charcoal ('Darco' brand) and subsequent elution with 80 per cent ethyl alcohol. This concentrated solution showed much higher potency both by the agar-cup method and serial dilution test. It was also used with very favourable results in 1 c.c. ampoules administered intramuscularly in seven severe typhoid cases in the typhoid ward of the Hospital, supplemented by oral administration of the crude filtrate. Attempts are being made to purify it further. I propose to name the active substance 'campestrin', derived from the local *Psalliota campestris*.

I am grateful to the Council of Scientific and Industrial Research, Government of India, for a research grant to carry out this work.

Germination of Chlamydospores in the Endogonaceae

No reports have been published of the germination of zygospores or chlamydospores in the Endogonaceae. Thaxter[1], writing in 1922, stated that no success had followed attempts to germinate the spores in any member of the group, and he mentioned his own unsuccessful efforts with the zygospores of *Endogone pisiformis* Link.

Since September 1953, repeated attempts have been made to germinate chlamydospores of *E. macrocarpa* (Tul.), Tulasne and *E. microcarpa* (Tul.), Tulasne, and zygospores of *E. lactiflua* Berk. No success has been obtained with the latter; but chlamydospores of both the former species have been observed to germinate on plain agar.

Spores of *E. macrocarpa* from certain fruit-bodies among those collected in the autumn of 1953 were successfully germinated. Some germinated at once and others after an interval of several months, during which time they were stored in soil. Those of *E. microcarpa*, collected at the same time, were first observed to germinate when plated out in the following spring. Spores from fruit-bodies of *E. macrocarpa* collected in 1954 have failed to germinate when placed under similar conditions, but germination of *E. microcarpa* spores has been observed at intervals during the year.

The spores which germinated were derived only from a few fruit-bodies among numerous collections, and often represented but a small proportion of the spores in those fruit-bodies. No stimulation of germination was achieved by a wide range of treatments, including alternate wetting and drying, mechanical rupture of the spore wall and exposure to extremes of heat and cold. It seems likely, therefore, that the percentage germination is a function rather of the state of the fruit-body than of the environment.

The mode of germination of the chlamydospores is illustrated in Fig. 1. The hyphæ which grow out from the spores are very similar in the two species,

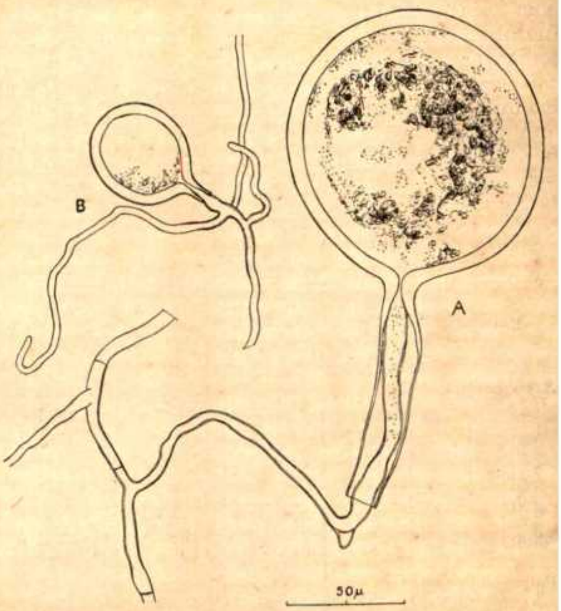

Fig. 1. Germinating chlamydospore of (*A*), *E. macrocarpa*, (*B*), *E. microcarpa*

articularly with regard to the mode of branching he new hypha emerges from the stump of the old ne on which the spore was produced. It grows lowly and occasionally gives off branches which may nastomose with nearby hyphæ The formation of erminal or intercalary chlamydospores on the nycelium so produced has sometimes been observed It is hoped to publish a fuller account elsewhere.

A Polyhaploid Plant of *Solanum polytrichon* Rydb.

S polytrichon Rydb. and *S. stoloniferum* Schlechtd. re two related tetraploid species, $2n = 48$, in the ongipedicellata group of tuberous *Solanums*. Using e former as female parent, Dodds (unpublished ork) obtained a good seed set in a cross between em, but only one seed germinated. This plant had e chromosome number $2n = 24$, suggesting that it ught be a polyhaploid of *S polytrichon*, having isen by haploid parthenogenesis. The plant was lorotic and this fact is evidence in support of a arthenogenetic origin, as the parental plant of *S olytrichon* (Commonwealth Potato Collection No 30.1) used was known to be heterozygous for a ngle recessive gene for chlorosis (Dodds, unpublished ork). The polyhaploid was also smaller and slower owing than the normal plant. Table 1 shows the rminal leaflet index and stomatal length of the lyhaploid compared with those of *S. polytrichon* P.C. 2330 1) and its normal and chlorotic segre-tes. A least-squares analysis of the data in Table 1 owed the reduction in both the leaflet index and omatal length of the polyhaploid to be significant, d to be a direct consequence of the halved chromo-me number and not of the fact that the plant was lorotic Similar reductions in leaf index and omatal length were observed in polyhaploid *S missum* Lindl. by Howard and Swaminathan[1], and so in the 24-chromosome plant, supposedly haploid, m the cross *S chaucha* $2n = 36 \times$ *S. tuberosum* $= 48$, Lamm[2]. Narrow leaflets (low leaf index) em to be a valuable morphological character for stinguishing *Solanum* polyhaploids

Table 1

Material		Chromosome number, $2n =$	Mean terminal leaflet index ± *S EM*	Mean stomatal length* ± *S EM*	Habit
polytrichon C P C 2330 1		48	82 0±1 57	23 7 ±0 32	Normal
Segregates of *S polytrichon* C P C 2330 1	1	48	82 7±1 39	20 9 ±0 47	
	2	48	90 0±1 49	21 3 ±0 37

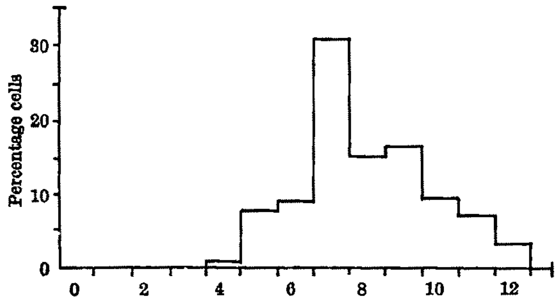

Fig 1. Bivalents per cell in polyhaploid *S polytrichon*

At meiosis in *S. polytrichon* (C.P.C. 2330 1), 24 bivalents are regularly produced, whereas in the polyhaploid there is a considerable reduction in bivalent formation. In an analysis of seventy-four cells at metaphase I, the mean number of bivalents was 7·9 ± 0 55 The range and frequency of bivalents per cell are shown in Fig. 1.

This behaviour contrasts with that in normal diploid *Solanums*, where complete pairing is invariably the rule. Also in the haploid *S. tuberosum* L studied by Ivanovskaja[3], eleven to twelve bivalents were formed, while the 24-chromosome plant reported by Lamm[2] showed almost complete pairing at meiosis.

Reduction in bivalent frequency per cell has been shown to be a reliable indication of genomic differentiation in polyhaploid *S. demissum* (Marks[4]). Consequently, it is also reasonable to interpret the reduced bivalent frequency in polyhaploid *S polytrichon* as indicating differences between its two sets of twelve chromosomes This implies that *S polytrichon* itself is essentially allotetraploid. A similar conclusion has been reached by Swaminathan[5] for other species in the group Longipedicellata. The polyhaploid rarely comes to full flower, and even then it is completely sterile. It produces tubers quite readily.

Heterogeneity of Date Fruits

When I was washing a population of date fruits collected from one and the same palm tree, variety "Hayyani", I noticed that some fruits floated to the surface of the water while others sank to the bottom of the vessel. I then analysed samples of both floating and sunken fruits and found much smaller sugar content in the former than in the latter. It was therefore thought advisable to investigate the possibility of floating such fruits in water and also in aqueous solutions of sodium chloride as a criterion for segregation of such population into more or less homogeneous batches with regard to their sugar con-

Determined matter	Analysis of the fruits floating on						Fruits sunk in 10% NaCl
	Dist water	2% NaCl	4% NaCl	6% NaCl	8% NaCl	10% NaCl	
Dry matter	24 45	27 15	29 16	30 22	32 45	34 55	39 40
Red sugars	6 14	6 22	6 11	5 93	6 09	6 35	6 27
Sucrose	5 03	7 22	8 84	9 47	12 40	15 81	17 75
Total sugars	11 17	13 44	14 95	15 40	18 49	33 16	24 02

tents This was done by putting the whole fruit population in a big vessel containing distilled water and then collecting all the fruits that floated as one batch , the sunken fruits were afterwards put in aqueous solutions containing 2, 4, 6, 8 and 10 per cent pure sodium chloride, and in each case the floating fruits were collected, washed with distilled water and finally analysed (after excluding the seeds), together with the last batch which sank in the 10 per cent sodium chloride solution.

The accompanying table shows the dry matter as well as the sugar content of each batch calculated in terms of grams per 100 gm. fresh weight of the fruits.

It appears clear from the table that although the population of the date fruits was collected from the same tree and at the same time, yet the fruits varied enormously in their dry-weights, the essential variation being in their sugar contents, especially the sucrose fraction. The fruits that floated on distilled water showed smallest dry-weight and also smallest sucrose content, while the samples that sank in 10 per cent sodium chloride solution showed largest dry-weight and also the highest sucrose content. It is interesting to note that the hexose content of all fruit batches fluctuated but little.

The above-mentioned experiment may, therefore, serve as basis for successfully preparing homogeneous date samples, thus minimizing the sampling error and reducing the number of replicates to be analysed under different experimental conditions.

Imino-Acids in *Santalum* Leaves

Attention has been directed by Giri, Gopalkrishnan, Radhakrishnan and Vaidyanathan[1] to the high content of free hydroxyproline in the leaves of *Santalum album* L , and of free proline in the leaves of various species of *Citrus* Their observations are of interest, as these imino-acids have previously been reported only as minor constituents of the soluble nitrogenous compounds of plant tissues, though they occur regularly as constituents of plant proteins Hydroxyproline in particular has rarely been detected as a component of the soluble nitrogen in plant tissues

Extracts of leaves from two Australian species of *Santalum* have now been examined by paper chromatography. With *S obtusifolium*, the most prominent reactions with ninhydrin and isatin were given by proline, hydroxyproline (confirmed by the specific test of Jepson and Smith[2]) and glutamine, with *S murrayanum* proline gave by far the most prominent spot, but hydroxyproline was also present. There are thus several species in which proline accumulates to comparatively high concentrations which is not entirely surprising in view of its known[3], relationship in various organisms to glutamate, th central metabolic position of which is generall acknowledged

Other 'unusual' amino-acids known to accumulat in individual species include arginine in seedling of various conifers, especially *Abies pectinata*[4,5], an citrulline in roots and root nodules of *Alnus glutinos* and *A incana*[6] The range of plant material examine for amino-acids is still very limited, and the detectio of other 'unusual' amino-acids by simple surve experiments may be anticipated Such plants, a suggested by Giri *et al* [1], may well provide usef sources of compounds not readily accessible t synthesis.

Effects of Trace Metals, Oxygen and Light o the Glucose–Glycine Browning Reaction

The reaction of amino-acids and sugars to for brown-coloured products (Maillard reaction) h attracted the attention of many investigators Although such variables as the type of sugar and amino-acid, concentration of reactants, pH, temper ture, and catalytic effects of buffers have bee recognized and controlled in model experiment results of different workers are still difficult reconcile

In recent studies we have found that, under son conditions, the rate of development of colour glucose–glycine solutions is strongly influenced trace amounts of manganese or of iron, by oxyg and by light In a typical experiment illustrati the manganese effect, an aqueous solution contain 0 448 M D-glucose, 0 458 M glycine, 0·0105 disodium hydrogen phosphate, 0·0053 M potassiu dihydrogen phosphate, and 0 4 p p m. mangane (as manganese chloride) was allowed to react in t dark at 50° in sealed glass tubes with air in the hea space. The amount of colour measured at differe time-intervals was 17–24 per cent less than in co trols without manganese (Table 1). In the presen of 2 p p m of manganese there was a 30–40 per ce decrease in the amount of colour formation. (T remarkable sensitivity of the reaction to mangane is illustrated by preliminary experiments carried o

Table 1 INHIBITION OF THE GLUCOSE–GLYCINE BROWNING REACTION BY MANGANESE

Time (hr)	Optical density at 420 mμ* Control	0 4 p p m manganese ions
0	0	0
17	0 020	0 016
39 5	0 193	0 159
46	0 274	0 225
96	1 301	1 077

* Averages of five replicates

under somewhat different conditions and with 'reagent'-grade chemicals Significant inhibition of browning was observed with as little as 0 003 p p m of added manganese. These experiments were repeated independently and confirmed by Miss M Gee of this laboratory.) Manganese was found to inhibit the rate of browning of the solutions in air or oxygen, but under nitrogen no such effect was observed.

In contrast to manganese, iron accelerated the reaction. In a similar system but under oxygen, samples containing 2 p p m of added iron (as ferric chloride) instead of manganese developed four or five times as much colour as controls (Table 2).

Table 2 ACCELERATION OF GLUCOSE–GLYCINE BROWNING REACTION BY IRON

Time (hr)	Optical density at 420 mμ* Control	2 p p m ferric iron
45	0 049	0 271
49	0 065	0 316
66 5	0 151	0 555

* Averages of four replicates

In the course of these experiments, the strong sensitivity of the browning reaction to oxygen and to light was observed In the experiments just described, control samples with no added iron or manganese but sealed under nitrogen developed two to three times as much colour in the dark at 50° as controls sealed under air Light from ordinary laboratory illumination accelerated the reaction in the absence of oxygen On the other hand, partly browned solutions under oxygen or air, when exposed to laboratory illumination at 25°, were gradually bleached, the optical density decreasing 50 per cent in about a week No loss of colour was observed in similar samples sealed under nitrogen

The reagents used for this study were Bureau of Standards D-glucose No 41, Eastman Kodak Co white label' glycine recrystallized twice, spectroscopic standard solutions of manganous chloride and ferric chloride, Bureau of Standards *p*H standard phosphates, and distilled water redistilled in glass. Colour readings were obtained with a 420-mμ filter n an Evelyn photoelectric colorimeter (mention of products does not imply that they are endorsed or ecommended by the Department of Agriculture over others of a similar nature not mentioned)

Further details of these experiments and of others involving various amino-acids, amines, sugars and carbonyl compounds will be given in a forthcoming publication.

Copper – Molybdenum – Sulphate Interaction in Induction of Hypocuprosis

OVINE hypocuprosis has been reported in Australia on pastures containing less than 3–5 p p m. of copper[1] In contrast, British workers have reported a similar syndrome on pastures containing 7–20 p p.m. copper[2]. An explanation of this apparent anomaly has been proposed by Dick, based on his findings on the effects of molybdenum[3] and, more recently, sulphate[4–6], on copper metabolism.

We have now diagnosed ovine hypocuprosis, characterized by white banding of black wool, enzootic ataxia, and, though not marked, dystrophic ('steely') wool, on pastures in New South Wales containing 3–10 p p m copper, 3–9 p.p.m. molybdenum and 0 1–0 7 per cent sulphate. In order to ascertain if these levels of the three factors could have been responsible for inducing the hypocuprosis, a pen experiment has been carried out with a diet approximately reproducing the mean copper – molybdenum – sulphate status of the feed in the affected area, with suitable controls. The basal diet consisted of wheaten chaff 40, wheat 24, oats 30, meatmeal 5, urea ¾, limestone ½, salt ½, plus vitamin A and cobalt supplements. Merino weaners were used, with some black sheep included in all groups. All diets were fed *ad lib.* except in the case of group 3, which was fed at approximately half the intake of group 2 Details of treatments and results are shown in Table 1.

Table 1. EFFECT OF COPPER, MOLYBDENUM AND SULPHATE ON LIVER-COPPER OF SHEEP.

Group No	Composition of diet			No of sheep	Pre-exp * mean liver-copper (p p m dry wt)	Mean* liver-copper after 4 months (p p m dry wt)
	Copper (p p m)	Molybdenum (p p m)	Sulphate (per cent)			
1	6	0 7	0 04	6	254	169
2	6	5	0 4	7	222	45†
3	as 2, but at half-rations			6	203	39†
4	6	5	0 04	7	306	181
5	6	0 7	0 4	6	230	93†

* Samples for analysis were obtained at biopsy (ref 7)
† Falls in liver-copper of groups 2, 3 and 5 significantly ($P < 0\ 01$) greater than group 1, and of groups 2 and 3 significantly greater than group 4 ($P < 0\ 01$)

The rapid fall in liver-copper in the high molybdenum high-sulphate groups is apparent The mean liver-copper of groups 2 and 3 had dropped to 12 9 and 8·9 p p.m. respectively after eleven months. At the same time, the mean blood-coppers of groups 2 and 3 were 0 041 and 0·035 mgm. per 100 ml, as compared with mean values for normal sheep of *c.* 0 08 mgm. per 100 ml Dystrophic wool and white banding of black wool, similar to that observed in the field, were observed in the deficient sheep The results with group 3, on half the feed-intake of group 2, suggest that it is not so much the absolute intake of copper, molybdenum and sulphate which is important, but rather the concentration in the diet.

A feature of the experiment has been the demonstration of the profound influence of sulphate. The results from group 5 show that even when the molybdenum concentration of the feed was 0 7 p.p m., added sulphate caused a significant fall in liver-copper as compared with the controls. Later analyses have indicated that there is a large individual variability in the response to sulphate additions to low molybdenum diets, some sheep declining to less than

20 p p m. of copper in the liver on such a diet. Dick also has found that sulphate added to a diet providing 0 5 mgm. of molybdenum per day depressed the accumulation of copper by the liver[5].

It is apparent from these observations that, in conformity with Dick's hypothesis, the disparity between the copper-levels found in pastures associated with hypocuprosis can, at least in some cases, be explained by copper – molybdenum – sulphate interaction inducing low liver and blood copper-levels Dick has, of course, recently shown that very high levels of molybdenum and high levels of sulphate may result in dystrophic wool without a low level of blood- or liver-copper[8], but the present work appears to be the first demonstration of the induction of hypocuprosis associated with hypocupræmia and low liver-copper by adjusting the copper, molybdenum and sulphate to levels encountered in the field.

Bovine hypocuprosis in New South Wales has been associated with pastures containing 8–12 p p.m copper, 1–5 p.p m molybdenum, and 0 6–0 9 per cent sulphate. It seems probable that copper – molybdenum – sulphate interaction is also involved in these hypocuproses.

Ultra-violet Absorption Investigation of Melanins

ULTRA-VIOLET absorption studies demonstrate that the melanin of the ox-choroid is similar to the melanin obtained by the autoxidation of β-3 4 dihydroxyphenylalanine[1]. In the present communication, it will be shown that the melanin of the ox-choroid is identical with that of black human hair, while red human hair contains a pigment related to, but not identical with, these melanins

. Melanin was prepared from the ox-choroid as described previously[1]. Curve *A* (Fig. 1) depicts the ultra-violet absorption spectrum of choroid-melanin in *M* sodium hydroxide.

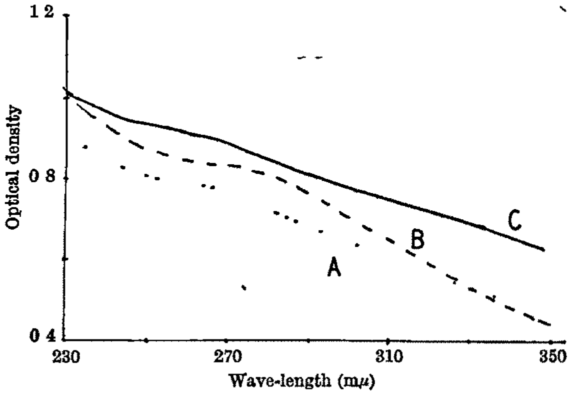

Fig 1

Samples of black and red human hair were defatted and boiled with 5 *M* sodium hydroxide for 12 hr. Most of the hair pigment dissolved, undissolved hair being removed by centrifugation. On acidification of the alkaline solutions, black pigments were precipitated and were sedimented by centrifugation. The supernatant acidified solution from the red hair was red in colour, that from black hair a pale yellow. The acid-precipitated pigments were soluble in alkali and could be purified by repeated solution in alkali and precipitation by acid. Curve *C* depicts the ultra-violet absorption spectrum of the purified black hair melanin, curve *B* that of the 'melanin' from red hair, both pigments being in solution in *M* sodium hydroxide.

It will be observed that the melanin from black human hair is identical with that from the ox-choroid, both pigments differing somewhat from the red hair 'melanin'.

On combining alkaline solutions of the acid-soluble and the acid-insoluble red hair pigments, a colour was obtained which matched the colour of the hair in its natural state. Thus, it does not seem likely that either pigment arose as an artefact during the preparation.

It is characteristic of the natural and synthetic melanins that they dissolve in alkalis, but are insoluble in acids By this criterion and by virtue of its colour, the acid-insoluble pigment from human red hair can be considered to be related to the 'true' melanins. It appears, therefore, that red human hair contains a melanin-like pigment in addition to the red pigment described by previous investigators[2].

The observations above indicate that ultra-violet absorption analyses may be useful in differentiating between various melanin pigments. It would be worthwhile, therefore, to extend such studies to include other vertebrate and invertebrate melanins.

I wish to thank Prof Joseph Gillman for advice and encouragement during this investigation.

Metabolism of Thyroglobulin labelled with Iodine-131

DIFFERENCES in the fate of thyroglobulin labelle with iodine-131 appearing in the plasma of patient treated with therapeutic doses of radioactive iodide have led us to study the metabolism of thyroid prote in animals. In rats, doses of radioactive iodid sufficient to destroy the thyroid gland result in th appearance of labelled thyroglobulin in the plasm The protein is speedily removed, radioactive thyroxin and iodide appearing in the plasma Administratio of rat thyroglobulin to normal rats or to rats which the gland has been previously eliminated b radioactive iodide gives the same pattern of event (Table 1)

Table 1 DISTRIBUTION OF RADIOACTIVE COMPONENTS OF RAT PLASMA FOLLOWING INTRAVENOUS INJECTION OF LABELLED RAT THYROGLOBULIN

Hours after dose	Percentage dose in plasma	Distribution of plasma activity (%)		
		Iodide	Thyroxine	Protein
2	25 8	7	3	90
6	17 8	8	0	92
23	6 3	12	6	82
47	1 1	21	14	65
73	0 5	31	13	56

Similar results were obtained when dog thyroglobulin was administered to dogs.

Dog thyroglobulin injected into rats is removed and metabolized much more slowly, similar results were obtained when rat thyroglobulin was injected into dogs Successive injections of the heterologous thyroglobulin induced an immune reaction whereby the injected thyroid protein was then removed extremely rapidly (Fig. 1). On the other hand, repeated administration of homologous thyroid protein, for example rat protein to rat, over a wide dose-range, failed to modify the rate of removal of the protein

This striking difference in behaviour between homologous and heterologous thyroglobulin in these two species indicates that a mechanism normally exists for the rapid and selective removal from plasma of homologous but not heterologous thyroid protein. It is tempting, on this evidence, to speculate that the thyroid gland may normally secrete thyroglobulin which is then rapidly metabolized, liberating iodide and thyroxine. Failure to detect thyroglobulin in plasma[2] could be due to its speedy removal keeping circulating thyroglobulin at levels below the limits of detection by available methods.

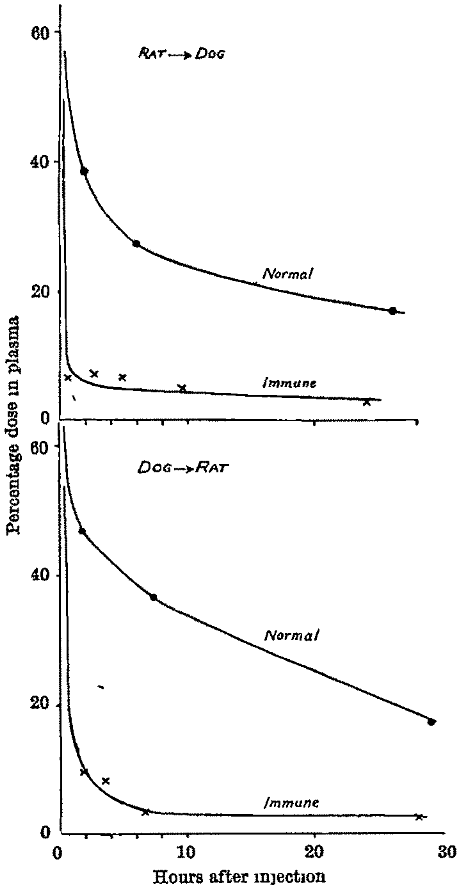

Fig 1 Removal of radioactive thyroglobulin from the plasma of normal and immune animals Upper graph, rat thyroglobulin to dog, lower graph, dog thyroglobulin to rat In the immune animals more than 90 per cent of the residual radioactive material after a few hours consists of iodide, thyroxine and iodotyrosines

However, the first administration of rat thyroglobulin to monkeys resulted in its rapid removal from plasma, with the appearance of iodide and thyroxine.

Clearly, variations exist between species in their ability to metabolize homologous and heterologous thyroglobulin. This investigation is being extended to other species, and full details will be published elsewhere.

Relation of Colour Change to Moulting in Prawns

STUDIES of crustacean hormones have heretofore been concentrated either on chromatophorotropic actions, or upon effects on moulting and related metabolic phenomena. We have now obtained evidence that, in *Leander serratus* (Pennant), the chromatophorotropic hormones are also concerned in the intermoult cycle Numerous previous studies have shown that eyestalk removal accelerates moulting in many species of crustaceans, including *L. serratus*[1]. We found that, in a series of 114 eyestalkless animals, only two moulted, while of 146 normal animals kept under identical conditions, twelve moulted This difference is statistically significant at the 5 per cent level of probability We are unable to account for the difference from Drach's results[1], but Carlisle (personal communication) has suggested that there are important racial differences between prawns of the same species at Naples, Roscoff and Plymouth Analysis of the effect of removal of eyestalk showed that it could be attributed to an increase in length of stage D_2 of the intermoult cycle[2], during which the old integument is undergoing resorption, and the new integument is being formed, and to an increased mortality immediately preceding the moult in eyestalkless specimens.

Examination of the chromatophores of the animals used in the eyestalk-removal studies showed that these undergo a small but significant cyclic change in state of dispersal of pigment during the intermoult cycle. Moreover, the state of dispersal in each of four major groups of chromatophores can be correlated with the duration of one or more of the stages of the intermoult cycle. For example, the large red chromatophores of the body stripes are significantly more concentrated in animals which pass rapidly through stage D_2 than in those which die before completing the transition to the next stage, marked by softening of the old integument. Likewise, the duration of stage D_3, immediately preceding the moult, is correlated with the state of dispersal of the blue pigment of the stripes. In eyestalkless animals, all the pigments studied are more widely dispersed than in normals, most of the cyclic changes are abolished, and there is no correlation between the length of any stage and the dispersal of the pigments This suggests that the major control of the intermoult cycle resides in the eyestalks

Extracts of eyestalks and central nervous systems of the prawns in sea water were tested for chromatophorotropic effects, already demonstrated in this species by Knowles[3] Concentrating factors were found for all four pigment groups observed, in both types of extracts. Dispersing factors for two groups were present in the central nervous system, and for one group in the eyestalks Only a fraction of the extracts exhibited any one of these effects. The frequency of appearance of any effect was not correlated with the colour of the donor, but in some cases there was a marked variation of frequency with stage of the donor in the intermoult cycle

A detailed analysis of the results leads us to the conclusion that at least five chromatophorotropic hormones are concerned in events which determine the duration of specific stages in the intermoult cycle, and that none of these hormones is identical with the moult-inhibiting hormone described for several other crustaceans. Our results provide no evidence of the operation of this latter hormone in *Leander serratus*; but neither do they show that it is not involved. A more detailed account of the methods and results will appear in *Pubbl Staz. Zool.*

Aphid Take-off in Controlled Wind Speeds

DAVIES has demonstrated[1] in a wind tunnel that *Myzus persicae* Sulz did not take to flight in wind speeds greater than 3 75 m p h His experiments, and field observations by other research workers, have given rise to a generalization that aphids do not take off in wind velocities greater than 5 m p h [2]

Recent work at Rothamsted has shown that alate aphids (for example, *Aphis fabae* Scop. and *Brevicoryne brassicae* L.), when in the highly active state through which they pass on reaching flight maturity, proved able to take off in wind speeds up to 6–7 m p h [3] Wind velocities of 3 m.p h continuously maintained caused a delay of 4–10 hr for first take-off, wind speeds of 5 m.p h a delay of approximately 24 hr or even more After these extensions of the normal preflight period, summer migrants of *A. fabae* and *Br. brassicae* took off with great regularity.

Further experiments were carried out to examine whether the ability to take off in relatively high wind speeds is a general feature of aphids or whether it is restricted to certain species. The tests were made with twenty species of host-alternating and non-host-alternating aphids and adelgids and the seasonal forms. In the following summary, wi speed is considered apart from other environment factors, for its influence appeared to be over-ridin

The newly moulted alatæ were transferred small leaves of their breeding host plant which we kept in fresh condition. Exposed to the wind, t aphids usually took off from the exposed side of t leaf into or diagonally against the wind directio The actual take-off, with very few exceptions, was voluntary process often undertaken after many tria Once in the air, the aphids immediately lost contr over their flight direction and were blown away ev by wind speeds as low as 1 2–1 5 m p h

As a rule, tree aphids tested in the wind tunn took off less readily and in smaller proportions wind-velocities of 5 and even 3 m p h. than *A fab* and *Br. brassicae*, but they kept their ability to f in calm air over long periods The experimen included the following non-host-alternating specie *Cinaropsis pilicornis* Hartig, *Periphyllus aceris acer* *cola* Wlk , *Euceraphis punctipennis* Zett., *Phyllaph* *fagi* L , *Drepanosiphon platanoides* Schr , *Eucallipter* *tiliae* L and *Tuberculoides annulatus* Hartig. It w noticed that the beech aphid *Ph. fagi* flew well calm air on its twelfth day, the birch aphid *punctipennis* on its thirtieth day after collection an *Drepanosiphon platanoides* on the seventieth da after the last ecdysis Early autolysis of flig muscles, as recently demonstrated for *A. fabae,* *persicae* and others by B Johnson[4], does not occ in these species, as will later be shown in more deta

In wind velocities of 5 m p h the adelgids, to were characterized by a noticeably hesitating b haviour, but take-offs in 3 m p h could be observe for *Adelges strobilobius* as well as *Adelges abietis* Hard

More willingness to take off in relatively high win was generally demonstrated by the host-alternati aphids, among which the spring migrants on the primary host were characterized by a remarkab energy. The following species proved able to take o with great regularity in wind speeds of 5 m p h. aft only a few hours delay, and often within the fir 24 hr. after their last ecdysis *Rhopalosipho* *insertum* Wlk., *Aphis evonymi* F., *Brachycaud* *helichrysi* Kltb., *Longicaudus trirhodus* Wlk an *Hyperomyzus lactucae* C B.

As a rule, summer migrants (for example, *A. fab* and *Br. brassicae*) appeared to lack this energy an preferred the lower speeds to the higher, but we able to take off in different speeds of 3–6 m.p. after a sufficiently long delay of their departure, shown before.

No take-off, however, was observed for *Macr* *siphon euphorbiae* Thos. = *M solanifolii* Ashm wind velocities of 5 m.p.h , but in some cases f *Megoura viciae* Bckt.

Autumn migrants of *A. fabae* and *Br. brassic* took off readily in the highest wind speeds teste (7 2 and 6 9 m.p.h. respectively) *A. fabae* alatæ al proved able to start in speeds of 5–6 m.p h eve after three to four days of previous flight exercis when kept on their secondary host plant[3]. This ma indicate a special take-off behaviour which, so f as autumn migrants are concerned, does not appe to be limited to first departures

The differences in the behaviour between the speci as well as between their seasonal forms, briefly out lined above, will have to be interpreted in the lig of their migratory flight as well as their host-pla relationship.

This work will be published later with special reference to its ecological aspect. I am grateful to Dr. C. G. Johnson for criticism, and to Dr. J. P. Doncaster and Dr. H. L. G. Stroyan for help in identifying a number of species.

Formation of the Infection Bulb in *Arthrobotrys oligospora* Fresenius

IN network- and knob-forming Hyphomycetes which are predacious on nematodes, it has long been considered that the structure known as the infection bulb is in some way instrumental in bringing about the death of the prey.

This structure, a kind of internal appressorium, can be observed in the early stages of infection, that is, soon after the capture of the eelworm, as a bulbous extension of the hypha of the attacking fungus within the body of the nematode, just at the point of invasion. It is from this bulb that the trophic hyphæ grow out and extend throughout the body of the worm.

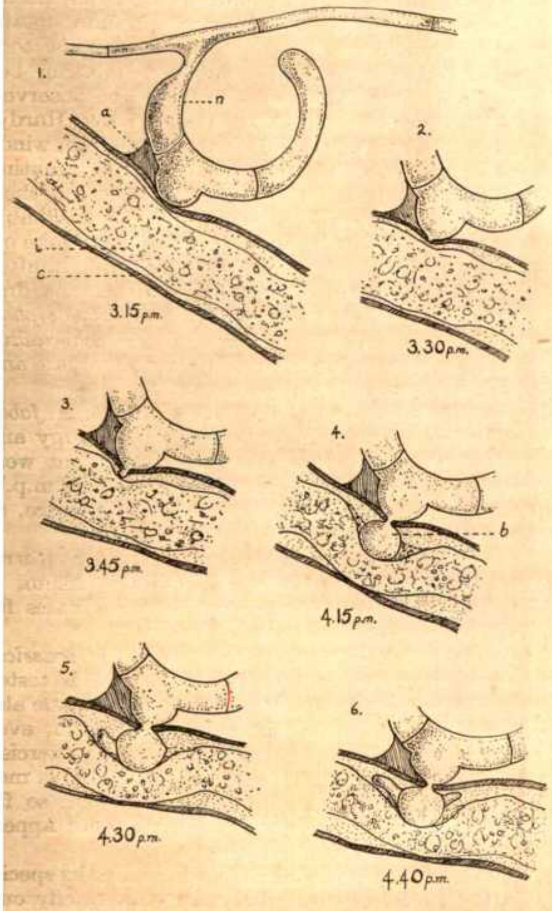

Fig. 1. *Arthrobotrys oligospora*. Observed stages in the development of the infection bulb. *a*, Adhesive substance; *b*, infection bulb; *c*, cuticle of nematode; *i*, intestine; *n*, primary branch of network

Drechsler[1] refers to the bulb as a 'mortiferous' structure and considers that it is a mechanical action by which the nematode is killed, the bulb filling the diameter of the body to such an extent that death is brought about because of the virtual severance of the body which results. Duddington[2] regards this view with some uncertainty.

From observations made on the formation of the infection bulb in *Arthrobotrys oligospora* Fres., the whole development of the bulb was traced from the early stages of capture, when the nematode was moving vigorously, to the final stage when the nematode had ceased to move, being either dead or paralysed. The fungus was observed while growing on maize-meal agar in a Petri dish. A cover-glass was placed over a drop of water on the surface of the agar and an oil immersion objective used with × 7 oculars. The resulting light intensity was not sufficient to permit the use of the camera lucida, the accompanying figures being free-hand drawings of the observed stages (Fig. 1).

The noticeable features of these observations were first, the rapidity with which the haustorium and infection bulb were formed when once invasion had started, the bulb reaching its maximum size within 45 min. of the inception ; secondly, the rate at which movements of the nematode were reduced very soon after the invasion occurred, becoming considerably inhibited as soon as the haustorium had penetrated the cuticle (stage 3, Fig. 1), and ceasing completely shortly afterwards (stage 5). It is also of interest that, in this particular instance, the infection bulb never reached a size greater than about half the diameter of the worm. It is questionable whether the partial obstruction of the body cavity thus produced could, in itself, bring about such a rapid death of the host.

This work was carried out under a scholarship from the British Council, to which my thanks are due. I am also indebted to the Director and staff of the Danish State Experimental and Research Station for Plant Diseases and Pests, Lyngby, for providing the necessary facilities.

Electron Diffraction Pattern of Mica of Various Thicknesses

N-PATTERNS of spots from thin crystals, and Kikuchi-lines from comparatively thick ones, have been observed by several workers[1] as electron diffraction patterns from mica. In this study a flake of mica having various thicknesses was stuck on a mesh of 0·1 mm. diameter by means of methyl alcohol and was then placed on the projection lens of an electron microscope so that electron micrographs and electron-diffraction patterns of the mica might be taken. First the electron image of the mica (Fig. 1*a*) was observed, then the incident electron beam was converged on it (the least area illuminated

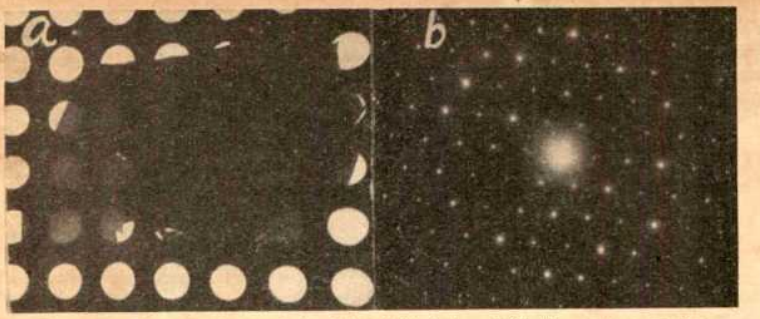

Fig. 1. (*a*) Electronmicrograph (× 47) and (*b*) electron diffraction pattern of mica

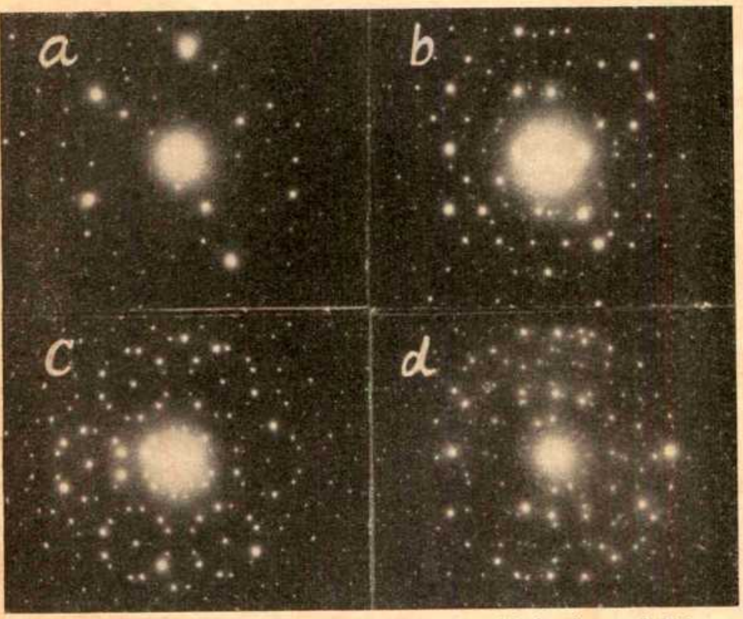

Fig. 2. Various electron diffraction patterns appearing with the change of thickness of mica

by the electrons was a circle of about 0·01 mm. diameter), and was moved horizontally to the part of the mica to be observed having the desired thickness. Then the electric current through the projection lens was switched off, and afterwards the electron diffraction pattern of one part of the mica (Fig. 1 *b*) was observed. The thickness of each part of the mica was determined relatively by comparing the intensities of the transmitted electrons.

In the case of a very thin crystal (about 400 ∼ 500 A.) an *N*-pattern with many missing diffracted points appeared (Fig. 2 *a*). With increased thickness of the mica the electron diffraction pattern changes successively as follows: (1) a perfect *N*-pattern was first obtained (Fig. 1 *b*), (2) a pattern such as that shown in Fig. 2 *b* appeared next, (3) a pattern such as that shown in Fig. 2 *c* was then obtained, and later, (4) a pattern such as Fig. 2 *d* appeared. With still further increase in thickness of mica, a pattern as shown in Fig. 2 *a* appeared again, after passing through the patterns of Figs. 2 *c*, *b* and then Fig. 1 *b* successively. In the case of mica having such thickness as this, Kikuchi-lines begin to appear; but where the crystal was so thick that many Kikuchi-lines would be expected to appear, it showed an *N*-pattern of spots as already observed. If there exists such interesting periodic changes in electron diffraction patterns with the increase in thickness of mica, the pattern such as Fig. 2 *b* or *c* should be obtained in the case of a thicker mica than that in which the pattern of Fig. 2 *d* appears. As a matter of fact, such patterns were obtained in the case of mica so thick that the central spot shows pronounced halation.

In the cases of bent crystals, all patterns were blurred through charging-up. By means of the condenser lens, two neighbouring parts of mica having different thicknesses were observed independently, and then an electron diffraction pattern was taken by using full illumination of electrons to cover the two parts of the mica. In this case the pattern obtained was the same as the superposition of the two independent patterns. Accordingly, the above-mentioned patterns were not due to an imperfect crystal, but rather the original structure of the mica. The electron diffraction patterns obtained in this study were therefore analysed as follows.

The pattern of Fig. 2 *b* may be considered as due to two crystal layers which consist of a fundamental crystal and a crystal rotated by about 10°. The pattern of Fig. 2 *c* would be due to a three-layer crystal group which consists of the fundamental crystal and crystals rotated at about 10° and 20°. The pattern of Fig. 2 *d* can also be explained as a four-layer crystal group consisting of the fundamental crystal and crystals rotated at the angle of about 10°, 20° and 30°. Furthermore, diffracted points from the fundamental crystal and a second or a third crystal superposed on each other are very bright, and the diffracted points of incident and exit crystals are brighter than those of intermediate ones. If we assume from these observations that mica grows as strata which rotate at the angle of about 10° successively, the periodicity of electron diffraction pattern with thickness of mica can be explained; patterns such as those shown in Figs. 2 *b*, *c* and *d* indicate the existence of rotational slip, as already discussed by H. Wilman[2].

However, from the results of this experiment in which the degree of electron transmission was adopted as the parameter of thickness, it is still premature to give a conclusive judgment whether such a crystal growth is the natural habit of mica or not. More precise observations are therefore in process. I wish to thank Mr. S. Takahashi for his assistance.

Reversible Polarographic Reduction of Niobium

THE polarographic reduction of niobium in concentrated hydrochloric acid[1], and in oxalate and tartrate solutions (ref. 2 and Mrs. B Lamb, private communication), has been shown to be due to reduction of Nb(V) to Nb(IV) Reductions in these media are, however, irreversible Recent studies on the precipitation of niobium with tannic acid from various complexing solutions (G. W C. Milner, G A. Barnett and A. A Smales, unpublished work) in this laboratory have indicated that niobium forms complexes with malic, citric, lactic and ethylenediamine-tetra-acetic acids We have found polarographic steps corresponding to the reduction of these complexes.

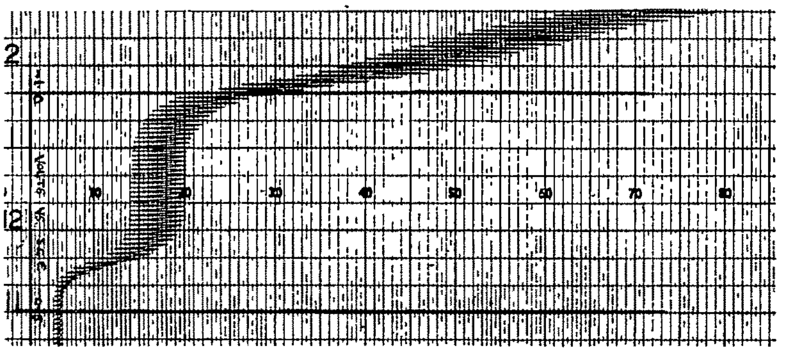

Fig 1

The reduction of niobium from solutions of the disodium salt of ethylenediamine-tetra-acetic acid produces polarographic steps (see Fig 1), at *p*H 3 05, $E_{1/2}(1) = -0\ 609$ V., $E_{1/2}(2) = -1\ 05$ V vs. the saturated calomel electrode. The second step coalesces with the hydrogen wave and is difficult to measure with conventional polarographic equipment The half-wave potential and reversibility (tested by measurement of the inverse slope of E against $\log_{10} i/(i_d - i)$ plot) of the first wave varies with *p*H.

*p*H	[EDTA]	$E_{1/2}$ (1)	Slope
2 00	0 001 *M*	−0 419	0 060
3 05	0 1 *M*	−0 609	0 059
3 20	0 1 *M*	−0 613	0 062
3 40	0 1 *M*	−0 615	0 069
3 60	0 1 *M*	−0 657	0 072
4 05	0 1 *M*	−0 767	0 100
4 75	0 1 *M*	−0 835	0 086

(A slope of 0 059 corresponds to a reversible one-electron reduction)

Studies in solutions at *p*H 3 20 show that the height of the first wave is proportional to the niobium concentration over the range 500–5 μgm /ml The occurrence of two peaks when the Barker square-wave polarograph is used confirms the reversibility of the electrode reactions[3], for the height of the peaks obtained is similar to that obtained from a thallium solution of the same molarity The first of these peaks can be used as a measure of concentration and extends the limit at which niobium can be measured to 0 1 μgm /ml.

A fuller account of this work will be published elsewhere

Inefficiency of Diphenylpicrylhydrazyl as a Radical Scavenger

IN the quantitative study of a reaction proceeding by a radical mechanism, it is of prime importance to know accurately the rate of generation of radicals in the system For this purpose, α,α-diphenyl-β-picrylhydrazyl has been used as a radical scavenger This material is a free radical and has the structure $(C_6H_5)_2N.N.C_6H_2(NO_2)_3$ It is stable itself but interacts with reactive radicals to give stable products, it has a strong purple colour and the rate of fading of this colour in solution has been used for measuring the rate of production of radicals in the solution[1]. Provided that the concentration of α,α-diphenyl-β-picrylhydrazyl is not very small, the calculated rate of production of radicals is independent of its concentration. This result suggests that the scavenger captures all the radicals which are produced

Azo-*iso*-butyronitrile is commonly used as a source of free radicals, its decomposition can be represented as

$$(CH_3)_2C(CN).N\ N.C(CN)(CH_3)_2 \rightarrow 2(CH_3)_2C(CN) + N_2$$

The decomposition can be followed either by measurement of the nitrogen evolved or by the use of α,α-diphenyl-β-picrylhydrazyl[1] The rate measured by the latter method is a little less than the rate measured from nitrogen evolution[2]. It appears that some of the radicals generated from the azo compound do not react with α,α-diphenyl-β-picrylhydrazyl but instead interact with one another to give stable products. Some of the papers presented at a recent meeting of the American Chemical Society dealt with this subject[3].

It has now been proved by a direct method that α,α-diphenyl-β-picrylhydrazyl does not react with all the radicals produced during the decomposition of azo-*iso*-butyronitrile in benzene solution If ^{14}C-azo-*iso*-butyronitrile is used, it is possible to determine with accuracy the products resulting from radicals escaping the scavenger A typical experiment can be summarized as follows. a mixture of 2 7 mgm ^{14}C-azo-*iso*-butyronitrile and 39 2 mgm. α,α-diphenyl-β-picrylhydrazyl in 1 35 ml. benzene was kept at 60° for 16 hr in the complete absence of air, it was found afterwards that the solution contained 0 15 mgm of tetramethylsuccinodinitrile formed by the combination of pairs of $(CH_3)_2C(CN)$ radicals If the velocity constant for the first-order decomposition of azo-*iso*-butyronitrile at 60° is $1\ 20 \times 10^{-5}$ sec $^{-1}$, the calculated weight decomposed is 1 35 mgm Work on the decomposition of this substance in benzene and other inert solvents[4] shows that other products are also formed from the radicals, and that for a decomposition performed under the conditions of this experiment 0 15 mgm. tetramethylsuccinodinitrile is equivalent to 0 40 mgm azo-*iso*-butyronitrile. It appears, therefore, that the radicals from only 0 95 mgm of the decomposed azo compound react with the nitrile, and that the scavenger reacts with only about 70 per cent of the radicals generated in the system.

It is also found that, when the azo compound is decomposed in the presence of styrene, some of the radicals are not used in initiating polymerization chains (unpublished results) The efficiency of initiation is independent of the concentration of monomer if its concentration is not small The failure of the scavenger and the monomer to capture all the radicals can be ascribed to a cage effect The radicals are generated in pairs and therefore their direct interaction is favoured.

The actual mechanism of the reaction between α,α-diphenyl-β-picrylhydrazyl and radicals is not certain[5], but it is hoped to obtain evidence using the carbon-14 compound This material has been synthesized and will be used for seeking the various possible products

Details of these and other experiments designed to study the action of radical scavengers will be published later I thank Prof H. W. Melville for his interest in this work

Use of Triethylammonium Buffers in Ion-Exchange Chromatography and Electrophoresis

IN preparative ion-exchange chromatography or electrophoresis of mixtures of low-molecular non-volatile compounds, it is essential to use buffer salts that are easily removed Many methods have been employed or proposed for desalting. Of these, only evaporation of the buffer can, in our opinion, be considered as entirely satisfactory, since it introduces no other operation than the one required for the removal of the solvent The number of volatile buffers in use so far is much limited, and those buffers do not meet all demands

For some time, buffers made from triethylamine have been used in ion-exchange chromatography and electrophoresis at this Institute Trimethylammonium salts may serve the same purpose, but we have found the triethylammonium salts preferable since triethylamine, due to its higher boiling point, is more convenient to handle and is easier to purify than is trimethylamine Triethylammonium formate, acetate, bicarbonate and carbonate are all volatile and cover the approximate *p*H ranges 3–6 and 7–12 In many respects these buffers are superior to all volatile buffers used so far (pyridinium[1], collidinium[2] and ammonium[3] acetates and formates) They have the following advantages (1) They can be removed by lyophilization (2) Ultra-violet absorption can be measured without prior removal of the buffer (3) A number of reactions proceed without complications in the presence of these buffers Particularly noteworthy is the fact that little or no interference takes place in the ninhydrin reaction according to Moore and Stein[4] when aliquots of 0 1–0 5 ml of column fractions are taken if the concentration of the amine is 0 1 *N* or less Much larger amounts of the amine may cause too high blank values (possibly due to traces of impurities) Disturbing background colour also results on paper containing triethylammonium buffer when the paper is strongly heated (4) They are stable towards oxidation (collidinium salts are anodically oxidized).

It is obvious that much time and labour may be saved when these buffers can be used for fractionation of mixtures containing both ninhydrin-positive and ultra-violet absorbing material Excellent fractionations of mixtures of amino-acids, in free and bound form, and purine and pyrimidine compounds have been obtained on 'Dowex 50' by the use of triethylammonium formate and acetate

Preparation of Hexachlorocyclohexane with 18–20 per cent Gamma-Isomer Content

IN Greece, hexachloro*cyclo*hexane was first synthesized during 1948, by the chlorination of benzene in white demijohns in the presence of sunlight. This method was convenient due to the clear sky of the country.

The hexachloro*cyclo*hexane so prepared was examined by La Clair's method, namely, rate of dehydrochlorination at 0° C, and it was found that it contained 8–10 per cent γ-isomer

It is well known that the insecticidal activity of hexachloro*cyclo*hexane depends upon its content of γ-isomer, and for this reason we investigated the possibility of increasing the γ-isomer content of our product Chlorinations under different conditions were carried out, and it was found that when the chlorination took place in yellow or red demijohns, instead of white ones, the product contained 18–20 per cent γ-isomer This increase in γ-isomer content is attributed to selective chlorination favouring the formation of the γ-isomer

The chlorination of benzene in monochromatic light must be further investigated in order to find out the real reason for the formation of hexachloro*cyclo*hexane with higher γ-isomer content Aiming at the commercial production of hexachloro*cyclo*hexane on a higher scale, we carried out the chlorination of benzene inside closed Pfaudler vessels, using fluorescent lamps and different temperatures From this work it was found that if the chlorination of benzene was carried out at a temperature of 35–45° C and mercury radiation 2537 A with a fluorescent substance (the lamp contains argon under 8 mm mercury pressure), zinc orthosilicate (for green light) and calcium tungstate (for blue light), then the product formed contains 18–20 per cent γ-isomer

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, March 14

British Society for the History of Science, Philosophy of Science Group (in the Joint Staff Common Room, University College, Gower Street, London, W C 1), at 4 30 p m Annual General Meeting 5 30 p m —Mr B A Farrell 'Scientific Method and Understanding of Persons"

University of London (in the Anatomy Theatre, University College, Gower Street, London, W C 1), at 5 30 p m —Prof T M Cherry (Melbourne) "Fact and Fiction in Elementary Dynamics" *

Manchester Literary and Philosophical Society (in the Reynolds Hall, College of Technology, Manchester), at 5 45 p m —Prof H N Rydon "The Structure of the Proteins"

Royal Society of Arts (at John Adam Street, Adelphi London, W C 2), at 6 p m —Prof Hugh Ford "Tensile Properties" (First of three Cantor Lectures on "The Mechanical Properties of Metals")

Institution of Electrical Engineers, London Students' Section (joint meeting with the Association of London Graduates and Students of the Institution of Civil Engineers and the London Graduates' Section of the Institution of Mechanical Engineers, at the Institution of Civil Engineers, Great George Street, London, S W 1), at 6 30 p m —Sir Miles Thomas, D F C "Air Transportation"

Tuesday, March 15

Institute of Physics, Electronics Group (at 47 Belgrave Square, London, S W 1), at 5 30 p m —Annual General Meeting, followed by Dr G F J Garlick "The Luminescence of Solids in the Infra-Red Region"

Institution of Chemical Engineers (joint meeting with the Chemical Engineering Group, Society of Chemical Industry, at the Geological Society, Burlington House, Piccadilly, London, W 1), at 5 30 p m —Scientific Papers

Institution of Civil Engineers (at Great George Street, Westminster, London, S W 1), at 5 30 p m —Mr Jack Robertshaw and Mr P D Brown "Geophysical Methods of Exploration and their Application to Civil Engineering Problems"

Institution of Electrical Engineers, Measurements Section (at Savoy Place, London, W C 2), at 5 30 p m —Dr J C West and Mr J L Douce "The Mechanism of Sub-harmonic Generation in a Feedback System", Dr J C West and Mr P N Nikiforuk "The Transient Behaviour of Remote-Position-Control Systems with a Hard Spring Non-Linear Characteristic"

University of London (at King's College, Strand, London, W C 2), at 5 30 p m —Sir Frederic Bartlett, F R S "The Man and the Weapons" * (Further lecture on March 22)

University of London (in the Anatomy Theatre, University College, Gower Street, London, W C 1), at 5 30 p m —Prof R W Russell "The Importance of Human Communication in Industry" *

British Ornithologists' Union (in the Meeting Room of the Offices of the Zoological Society of London, Regent's Park, London, N W 1), at 6 p m —Annual General Meeting

Tuesday, March 15—Thursday, March 17

Oil and Colour Chemists' Association (at the Royal Horticultural Society's Old Hall, Vincent Square, London, S W 1)—Seventh Technical Exhibition *

Wednesday, March 16

Geological Society of London (at Burlington House, Piccadilly, London, W 1), at 5 p m —Mr A A Day, Dr M N Hill, Mr A S Laughton and Mr J C Swallow "Seismic Prospecting in the Western Approaches of the English Channel", Dr D W Powell "Gravity and Magnetic Anomalies in North Wales" (Paper will be read by Dr D H Griffiths)

Royal Meteorological Society (at 49 Cromwell Road, South Kensington, London, S W 7), at 5 p m —Scientific Papers *

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 15 p m —Dr D R Cox "Some Statistical Methods connected with Series of Events"

Institution of Electrical Engineers, Supply Section (at Savoy Place, London, W C 2), at 5 30 p m —Mr R T Rushall and Mr J S Simons "An Examination of High-Voltage D C Testing Applied to Large Stator Windings"

Royal Microscopical Society (at Tavistock House, South, Tavistock Square, London, W C 1), at 5 30 p m —Mr E H Leach "Retinal Structure and Colour Vision"

Institution of the Rubber Industry, North Eastern Section (joint meeting with the Plastics Institute and the Royal Institute of Chemistry, in the Chemistry Lecture Theatre, King's College, Newcastle-upon-Tyne), at 6 30 p m —Dr A Charlesby "The Effects of High Energy Radiations on Rubber and Plastics"

Society for Analytical Chemistry, Microchemistry Group (in the Restaurant Room of "The Feathers", Tudor Street, London, E C 4), at 6 30 p m —Discussion on "The Direct Determination of Oxygen in Organic Substances"

Society of Chemical Industry, London Section (joint meeting with the London Section of the Royal Institute of Chemistry, in the Chemistry Lecture Theatre, King's College, Strand, London, W C 2), at 6 30 p m —Dr H Baines "Recent Advances in Photography"

Thursday, March 17

Royal Society (at Burlington House, Piccadilly, London, W 1), at 4 15 p m —Meeting for Election of Fellows 4 30 p m —Prof M J Lighthill, F R S, and Mr G Whitham "Kinematic Waves 1 Flood Movement in Long Rivers 2 A Theory of Traffic Flow on Long Crowded Roads"

Institution of Mining and Metallurgy (at the Geological Society of London, Burlington House, Piccadilly, London, W 1), at 5 p.m —Mr J J Brummer "The Geology of the Roan Antelope Orebody", Mr J H Sinclair "Handling Ore and Waste at Irwin Shaft, Roan Antelope Copper Mine"

Linnean Society of London (at Burlington House, Piccadilly, London, W 1), at 5 p m —Meeting on "Chemical Analysis in Ecology Illustrated from Lake District Tarns and Lakes" Mr F J H Mackereth "Chemical Differences", Dr J W G Lund "Algal Differences", Dr T T Macan "Faunistic Differences" (Freshwater Biological Association)

University of London (at University College Hospital Medical School, London, W C 1), at 5 p m —Dr Honor Fell "The Response of Organs in Culture to Environmental Influences" *

Royal Aeronautical Society (at the Institution of Mechanical Engineers, 1 Birdcage Walk, London, S W 1), at 6 p m —Monsieur Georges Hereil "Making Aeroplanes Independent of Runways" (Eighth Louis Bleriot Lecture)

Society of Chemical Industry, Road and Building Materials Group (in the Lecture Hall of the Institution of Structural Engineers, 11 Upper Belgrave Street, London, S W 1), at 6 p m —Dr J W Jeffery "The Practical Implications of Fundamental Research on Cement Hydration"

Society of Chemical Industry, Microbiology Group (in the Large Hall of the Medical Society of London, 11 Chandos Street, London, W 1), at 6 15 p m —Dr M Lumb "The Lesser Known Antibiotics"

British Glaciological Society (at Bedford College, Regent's Park, London, N W 1), at 7 30 p m —Mr P D Baird "Glacier Exploration in Arctic Canada"

Chemical Society (at Burlington House, Piccadilly, London, W 1), at 7 30 p m —Prof E L Hirst, F R S "Some Problems in the Chemistry of the Hemicelluloses" (Pedler Lecture)

Royal Society of Tropical Medicine and Hygiene (at the Royal Army Medical College, Millbank, London, S W 1), at 7 30 p m —Laboratory Meeting

Friday, March 18

Society for Water Treatment and Examination (at the Main Offices of the Metropolitan Water Board, Rosebery Avenue, London, E C 1), at 9 30 a m —Annual General Meeting, followed by Scientific Papers

Institution of Mechanical Engineers (at 1 Birdcage Walk, London, S W 1), at 5 30 p m —Annual General Meeting

Aslib (at the Royal Society of Arts, 8 John Adam Street, Adelphi, London, W C 2), at 6 p m —Discussion on "Recent Developments in the Universal Decimal Classification", led by Mr G A Lloyd

Society of Chemical Industry, Fine Chemicals Group (at the Westminster Medical School, 17 Horseferry Road, London, S W 1), at 6 p m —Discussion on "Chemical Aspects of Thyrotoxicosis"

British Society for the History of Science, Philosophy of Science Group—Northern Branch (in the University Staff House, The University, Manchester), at 7 p m —Dr Joseph Needham, F R S —"China's Philosophia Perennis , Organic Naturalism"

Saturday, March 19

Biochemical Society (at University College, Gower Street, London, W C 1), at 10 45 a m —Annual General Meeting, followed by Scientific Papers

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Research Assistants (2) (with a good honours degree in physics or physical chemistry) in the Department of Mining—The Registrar, The University, Leeds 2 (March 18)

Scientist, Grade 3 (with a good honours degree, or equivalent qualification in a science subject, and preferably with a sound background in geology and chemistry), at the Coal Survey Laboratory, Cardiff, for work which includes the preparation of detailed reports on the structure and physical and chemical properties of coal seams of South Wales, Bristol and Somerset, and Forest of Dean coalfields—The National Coal Board, Establishments (Personnel) Hobart House, Grosvenor Place, London, S W 1, quoting TT/932 (March 18)

Assistant Experimental Officer (with G C E (advanced) or a degree in botany or equivalent qualification) in the Unit of Plant Nutrition, Agricultural Research Council, Long Ashton, to assist in investigations on the effects of micro-nutrient elements on the growth of higher plants—The Secretary, Research Station, Long Ashton, Bristol (March 19)

Assistant (with an honours degree in chemistry or equivalent qualification, and preferably with teaching and/or industrial experience) at the College of Further Education, to teach chemistry up to final degree standard—The Director of Education, Education Office, Eleanor Street, Grimsby (March 19)

Scientific Officers (with a first- or second-class honours degree or equivalent in mathematics or mathematical physics) at the Royal Aircraft Establishment, Farnborough, Hants, for research and development on targets for guided weapons—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 36/5A (March 19)

RESEARCH ASSISTANT (with a good degree in mining, engineering or pure science) TO THE PROFESSOR OF MINING—The Registrar, The University, Sheffield (March 26)

ASSISTANT LECTURER (preferably with interests in applied mathematics) IN THE DEPARTMENT OF MATHEMATICS—The Secretary, University College London, Gower Street, London, W C 1 (March 28)

LECTURERS (2) ON PHYSIOLOGY—The Registrar, King's College, Strand, London, W C 2 (March 28)

HEAD OF THE DEPARTMENT OF ENTOMOLOGY—The Secretary, Rothamsted Experimental Station, Harpenden, Herts (March 31)

LECTURER IN ELECTRICAL ENGINEERING—The Registrar, The University, Birmingham 15 (March 31)

PRINCIPAL SCIENTIFIC OFFICER (with an honours degree in botany or agricultural botany, and research experience) to act as head of a department conducting research on the ecology and improvement of hill vegetation and on grassland agronomy on hill farms—The Secretary, Hill Farming Research Organization, Broomhouse Drive, Edinburgh 11 (March 31)

SENIOR LECTURER (graduate in science or technology and with extensive research experience with fibres) IN PAPER-MAKING TECHNOLOGY—The Registrar, College of Technology, Manchester (March 31)

CHEMICAL PATHOLOGIST to the Hospital and LECTURER IN CHEMICAL PATHOLOGY to the Medical College—The Clerk to the Governors, St Bartholomew's Hospital, London, E C 1 (April 1)

ASSISTANT LECTURER or LECTURER IN THE DEPARTMENT OF ZOOLOGY—The Registrar, The University, Liverpool (April 2)

CHAIR OF APPLIED MATHEMATICS—The Registrar, The University, Sheffield 10 (April 2)

LECTURER IN EDUCATIONAL PSYCHOLOGY—The Registrar, The University, Liverpool (April 2)

RESEARCH OFFICER (with a university honours degree or higher qualifications with chemistry as a major subject) IN THE DIVISION OF FOREST PRODUCTS, Commonwealth Scientific and Industrial Research Organization, S Melbourne, to carry out fundamental and applied research in various chemical aspects of wood preservation against fungi, termites, borers and marine organisms, etc —Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2 (April 2)

LECTURER (Grade 2) or ASSISTANT LECTURER IN MATHEMATICS at University College, Ibadan—The Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W C 1 (April 7)

LECTURER IN BIOCHEMISTRY at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (April 9)

SENIOR TECHNICAL OFFICER or PRINCIPAL TECHNICAL OFFICER (with a university degree in science or equivalent qualifications, and experience in the collection of samples and the complete analysis of coal) IN THE COAL RESEARCH SECTION, Commonwealth Scientific and Industrial Research Organization, North Ryde, New South Wales, Australia, to supervise the collection, preparation, testing and chemical analyses of coal samples in connexion with the Section's survey of the physical and chemical properties of Australian coals—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House Kingsway London, W C 2, quoting 480/152 (April 9)

ASSISTANT LECTURER (preferably with an interest in the geography of tropical regions and/or economic geography) IN GEOGRAPHY—The Secretary, University College London, Gower Street, London, W C 1 (April 12)

RESEARCH FELLOW IN THE DEPARTMENT OF GEOGRAPHY, Australian National University, Canberra—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Australia, April 15)

ASSISTANT BIOCHEMIST (with a B Sc degree with honours in chemistry or biochemistry) IN THE GROUP PATHOLOGY LABORATORY—The Administrative Officer, Withington Hospital, Manchester 20

ASSISTANT CONSERVATOR (with a degree in forestry, and preferably under 40 years of age) OF FORESTS, Cyprus—The Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S W 1, quoting BCD 61/17/01

ASSISTANT LECTURER IN AGRICULTURAL BOTANY—The Bursar, Royal Agricultural College, Cirencester Glos

ASSISTANT LECTURER IN GEOLOGY—The Registrar, The University, Nottingham

LABORATORY TECHNICIAN (with experience and skill in general bacteriological methods, and preferably with special experience in methods applicable to studies on viruses and tissue culture work)—The Secretary, The Foot-and-Mouth Disease Research Institute, Pirbright, Surrey

LECTURER (Grade B) IN PHYSICS—The Clerk to the Governing Body, Battersea Polytechnic, London, S W 11

LECTURER IN MECHANICAL ENGINEERING, with special reference to the rubber and plastic industries—National College of Rubber Technology, Northern Polytechnic, Holloway, London, N 7

PHYSICIST (with a degree in physics and preferably some industrial or research experience) IN THE FLUID DYNAMICS SECTION of the Physics Department in the Association's Laboratories in London, for work mainly on the treatment of gases and aerosols—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W 1, quoting "Fluid Dynamics"

RESEARCH ASSISTANT (with a good technical qualification or scientific training, and preferably some experience of vacuum technique or electronics) IN THE RESEARCH LABORATORY ON THE PHYSICS AND CHEMISTRY OF SURFACES, for work involving the maintenance, application and development of an electron microscope and diffraction camera, used in the research programme of the laboratory—The Secretary, P C S Laboratory, Department of Physical Chemistry, Free School Lane, Cambridge

SENIOR LECTURER IN GEOLOGY, specializing in Stratigraphy-Palæontology—The Dean, College of Arts and Sciences, Baghdad, Iraq

New Books

Radiobiology Symposium 1954

Edited by Professor Z M BACQ, University of Liège, and P ALEXANDER, Ph D , Chester Beatty Research Institute

This volume contains the papers which were presented at the meeting held in Liège in August–September, 1954, together with the discussions which arose from them The meeting was attended by scientists from twelve countries, and the majority of the papers report new experimental work Price 60*s*

Fundamentals of Radiobiology

By Professor Z M BACQ, University of Liège, and P ALEXANDER, Ph D , Chester Beatty Research Institute.

This book, written by a biologist and a physical chemist in collaboration, presents a balanced and coherent account of our present state of knowledge of radiobiology The importance of the subject for radiotherapists using radiation in the treatment of cancer, the necessity of avoiding the hazards to the health of the community in this age of nuclear fission, and the value of radiation in fundamental research on the cell have caused a great increase of late years in the number of those engaged in radiobiology, and this number is rapidly increasing This survey of the field as a whole therefore appears at an opportune time It will enable the specialist to assimilate developments in fields adjacent to his own and appreciate their possible effects on his particular work, and will provide those newly entering the field with a guide and an assessment of the present state of research Price 40*s*

LECTURES AND COURSES

CHELSEA POLYTECHNIC
MANRESA ROAD, S W 3
(Telephone FLAxman 5747)

Full-time courses and part-time day and evening courses are arranged in biology, botany, chemistry, geology, mathematics, physics, physiology, zoology, in preparation for the preliminary (intermediate) science examination and the B Sc general degree of the University of London for internal and external students, and for professional examinations Full-time or part-time courses are also held for the B Sc internal special or honours degrees in botany, chemistry (full-time only) geology, mathematics, pharmacy, physics, physiology (evening only) and zoology Facilities are provided for research and postgraduate study and short courses of lectures are held on special topics Full-time courses are arranged for professional qualifications in pharmacy and chiropody There are special evening courses in food and drugs, gemmology, industrial microbiology, and surgical technicians' work

Applications for enrolment for the Session 1955-6 may now be made on forms to be obtained from the Principal

OFFICIAL APPOINTMENTS

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged 18 *to* 64 *inclusive, or a woman aged* 18 *to* 59 *inclusive, unless he or she, or the employment, is excepted from the provisions of the Notification of Vacancies Order,* 1952

COMMONWEALTH of AUSTRALIA
COMMONWEALTH SCIENTIFIC AND INDUSTRIAL RESEARCH ORGANIZATION
APPOINTMENT OF SENIOR BIOCHEMIST
DIVISION OF PLANT INDUSTRY

The Division of Plant Industry proposes to appoint a leader for its research team in biochemistry which at present consists of seven research and technical officers The appointee is to reorganize and develop a research programme in fields of relevance to basic problems of plant growth There will be opportunities for collaborative research with workers in physiology, microbiology and genetics The appointee will be stationed at the main laboratories in Canberra Salary Dependent on qualifications and experience, commencing salary will be determined within the range of Principal Research Officer, £A 2,228 to £A 2,588, £A 90 increments, subject to efficiency review at £A 2,408 or Senior Principal Research Officer, £A 2,678 to £A 3,000 (three salary steps) subject to efficiency review at £A 2,678 Note The above salaries refer to a male appointee The appointment will be conditional on a satisfactory medical examination The appointee may be granted superannuation privileges Fares to Australia (including those of wife and family) will be paid

Applications, stating full name, place, date and year of birth, marital state, nationality, present employment, particulars of qualifications and experience, and of war service, if any, accompanied by the names and addresses of two persons willing to act as referees, if required and by copies of not more than four testimonials, should reach the undersigned not later than April 9, 1955 The Chief of the Division of Plant Industry, Dr O H Frankel F R S, will be arriving in England in the middle of April

Africa House,
Kingsway, London, W C 2

CIVIL SERVICE COMMISSION
DUBLIN
VACANCIES FOR ESTABLISHED CHEMISTS

Salary scale (Man) £485 to £1,118 Two vacancies at Johnstown Castle Agricultural College (under Department of Agriculture), for persons under 40 years with an honours university degree in chemistry or biochemistry, or an equivalent academic qualification , and one vacancy in the State laboratory for a person under 35 years with an honours university degree in chemistry or an equivalent academic qualification , and satisfactory experience of analytical or research work in a chemical laboratory Extensions of either agelimit in certain cases

Application forms and further particulars from the Secretary, Civil Service Commission, 45 Upper O'Connell Street, Dublin Latest date for receiving completed application forms, March 22, 1955

COMMONWEALTH of AUSTRALIA
COMMONWEALTH SCIENTIFIC AND INDUSTRIAL RESEARCH ORGANIZATION
APPOINTMENT OF HEAD OF CHEMISTRY/PHYSIOLOGY GROUP
DIVISION OF PLANT INDUSTRY

The Division of Plant Industry is responsible for research into the problems basic to plant growth and production in Australia Its Chemistry/Physiology Group conducts investigations in plant physiology, biochemistry, plant chemistry and related disciplines The Division now proposes to appoint as leader for this Group a scientist distinguished in one of its fields of interest and invites applications or inquiries There will be opportunities for collaboration with other Groups in the Division engaged in research in a variety of biological fields, and it is hoped that the appointee in this and other ways will contribute leadership and inspiration for the researches of the Division as a whole There will be ample opportunities for personal research The Division maintains close contact with research in Australian universities The appointee will be stationed at the main laboratories in Canberra Salary The commencing salary will be determined within the range of Senior Principal Research Officer, £A 2,678 to £A 3,000 (three salary steps) subject to efficiency review at £A 2,678 or Chief Research Officer, Grade 1, £A 3,200 , Grade 2, £A 3,400 The appointment will be conditional on a satisfactory medical examination The appointee may be granted superannuation privileges Fares to Australia (including those of wife and family) will be paid

Applications stating full name, place, date and year of birth, marital state, nationality, present employment, particulars of qualifications and experience, and of war service, if any, accompanied by copies of not more than four testimonials and the names and addresses of at least two persons willing to act as referees, if required, should reach the undersigned not later than April 9, 1955 The Chief of the Division of Plant Industry, Dr O H Frankel, F R S , will be arriving in England in the middle of April

UNIVERSITY COLLEGE OF KHARTOUM
SUDAN

Applications are invited for (1) Readership and/or Senior Lectureship in Mechanical Engineering (2) Lectureship or Assistant Lectureship in Mechanical Engineering (3) Senior Lectureship, Lectureship or Assistant Lectureship in Civil Engineering or Surveying Salaries Reader £E 2,170 per annum, Senior Lecturer £E 1,600 by £E 75 to £E 1,975 per annum, Lecturer £E 1,150 by £E 75 to £E 1,675 per annum, Assistant Lecturer £E 1,000 by £E 75 to £E 1,150 per annum Point of entry according to qualifications and experience Cost of living allowance now approximately £E 150 per annum Outfit allowance £50 on first appointment Passages for appointee and family on appointment, termination and leave (each long vacation after first) Appointment on contract for three to seven years (renewable) with bonus on completion (one month's salary for each year of service) No income tax at present payable in Sudan

Detailed applications (eight copies), naming three referees, to be received by April 7, by Secretary, Inter-University Council, 1 Gordon Square, London, W C 1, from whom further information may be obtained

SOUTH-WEST ESSEX TECHNICAL COLLEGE
AND SCHOOL OF ART
Forest Road, Walthamstow, E 17

The Governors invite applications for two Research Assistantships in Physical Chemistry, one to begin immediately, and the other in September, 1955 Stipend £350 per annum Candidates will be expected to prepare for a higher degree

Applications by letter should be made to the Clerk to the Governors at the College

---

UNIVERSITY COLLEGE LONDON (GOWER Street, W C 1) requires Assistant Lecturer in Department of Mathematics , preference will be given to applicants whose interests are in applied mathematics Duties to commence October 1, 1955 Salary £600 to £700 per annum, according to qualifications and experience Superannuation and family allowance —Applications, to be received by March 28, should be sent to the Secretary from whom further particulars may be obtained

COMMONWEALTH of AUSTRALI
APPOINTMENT NO 370/90 OF PHYSICI OR METALLURGIST THREE-YEAR PERIC
DIVISION OF TRIBOPHYSICS

The Commonwealth Scientific and Industr Research Organization invites applications fr physicists or metallurgists for appointment to position of Research Officer to work with t solid state group of the Division of Tribophysi located at the University of Melbourne T group is concerned with problems of plastic formation and phase transformations Initial the appointment will be made for a period three years but it may be extended Qualifi tions Research experience at least equivalent Ph D standard is essential Some experience the field of nuclear magnetic resonance would an advantage Salary Dependent on qualifi tions and experience, commencing salary will determined within the range of Research Offic £A 1,184 to £A 1,730 per annum and an app cant would be appointed at a commencing sala of not less than £A 1,394 per annum, accordi to qualifications and experience Fare Australia (including those of wife and family) w be paid also return fares in cases where t appointee does not take up permanent appoi ment with C S I R O at the expiry of his fix period

Applications, referring to Appointment N 370/90, and stating full name, place, date a year of birth, marital state, nationality, particul of qualifications and experience, and of war s vice, if any, accompanied by the names and a dresses of at least two persons willing to act referees, if required and copies of not more th four testimonials, should reach the undersign not later than April 23, 1955

TIONAL COLLEGE OF RUBBER TECHNOLOGY

RTHERN POLYTECHNIC, HOLLOWAY, LONDON, N 7

he Board of Governors invite immediate lications for appointment as Lecturer in hanical Engineering with special reference to rubber and plastic industries Candidates uld possess an engineering qualification with erience of rubber or a diploma in rubber nology with engineering experience Salary le, £1,015 by £25 to £1,115

orm of application, together with full particu- , will be sent on receipt of a stamped, ad- ssed foolscap envelope

R H CURRELL, A S A A,
Clerk

BRITISH CAST IRON RESEARCH ASSOCIATION

has vacancies on its Research Staff for men aged 22-35 qualified in any of the following metallurgy, physics, chemistry, engineering Experience in connection with iron-founding not essential An excellent avenue of approach is provided to a career n an enterprising industry The investigators are required for work on dephosphorization (involving considerations of ore beneficiation, blast furnace practice, top blowing, slag/metal reaction, cupola operation, etc), solidification mechanisms melting furnace operation, graphite formation, mould/metal reactions, moulding sands, the properties of cast iron at elevated temperatures, and other subjects Facilities are available for fundamental and for applied work Ample opportunity for travel, for continuous contact with industry, and ultimate employment within the industry The salaries will follow those of the Scientific Civil Service, and appointments will normally be in the Scientific Officer (£445 to £815 per annum), Senior Scientific Officer (£935 to £1 090 per annum) and Principal Scientific Officer (£1,090 to £1,472 per annum) grades, but special qualifications will receive consideration The Association is situated in the country, within easy reach of Birmingham and Redditch Superannuation

Applications to the British Cast Iron Research Association, Alvechurch, Birmingham, giving age, qualifications and experience

---

NORTH OF SCOTLAND COLLEGE OF AGRICULTURE

ASSISTANTSHIPS IN BACTERIOLOGY

Applications are invited for two vacancies in the Department of Bacteriology, and preference will be given to candidates with an honours degree in bacteriology or an equivalent qualification The successful candidates will be required to take part in the lecturing and advisory work of the department, and will be appointed to one of the following salary scales, with entry according to qualifications and experience Grade III, £596 2s to £936 14s (men) £515 10s to £811 6s (women) Grade IV(a) £440 6s to £596 2s (men), £440 6s to £527 4s (women) Grade IV(b), £419 2s to £596 2s (men), £4 9 2s to £527 4s (women) An opportunity will be available for investigational work and there is a superannuation scheme The successful candidates must be prepared to serve in any part of the College area

Further details and application forms may be obtained from the undersigned, with whom applications should be lodged not later than March 26, 1955

HUGH MUNRO,
Secretary

41½ Union Street,
Aberdeen

BIRKBECK COLLEGE

(UNIVERSITY OF LONDON)

Applications are invited for the following Assistant Lectureships Applied Mathematics Chemistry, with special reference to inorganic chemistry Organic Chemistry Geology, candidates should have special interests n palaeontology Psychology, candidates should have had experience of vocational guidance and time and motion study The scale of salary in each post will be £600 by £50 to £700 per annum

Further particulars should be obtained from the Secretary Birkbeck College, Malet Street W C 1 Closing date for applications April 9, 1955

UNIVERSITY OF BIRMINGHAM

ELECTRICAL ENGINEERING DEPARTMENT

Applications are invited for a Lecturer in Electrical Engineering (Grade II £650 by £50 to £1,350, according to qualifications and experience) Duties to commence as soon as possible There would be some preference for a candidate with industrial experience in electrical machinery or electric power

Three copies of applications, with the names of three referees, should reach the Registrar, The University Birmingham, 15, not later than March 31 1955 Further particulars may be received from the undersigned

G L BARNES
Secretary

The University,
Birmingham, 15

PROVINCIAL ADMINISTRATION OF THE CAPE OF GOOD HOPE

HOSPITALS DEPARTMENT

HOSPITAL BOARD SERVICE VACANCY

Applications are invited from suitably qualified applicants for appointment to the following vacant post at Groote Schuur Hospital, Observatory, Cape Town Technician, Grade B (E E G, Radiological Department) with salary on the scale £660 by £30 to £750 to £786 per annum In addition to the salary indicated a cost of living allowance at rates prescribed from time to time by the Administrator is payable The present rate is £234 for married male official and employees Conditions of service are prescribed in terms of Hospital Board Service Ordinance No 19 of 1941, as amended, and the regulations framed thereunder Candidates must be qualified radiographers and must be able to perform electroencephalographic duties The successful applicant will be required to submit satisfactory birth and health certificates and his/her appointment will be subject to the following conditions (i) Appointment will be on contract for five years in the case of a citizen of a Commonwealth country or the Republic of Ireland and six years in the case of a citizen of European countries other than the United Kingdom and the Republic of Ireland (ii) Transport expenses (third class by rail overseas and second or cabin class steamship fare and first-class by rail in the Union) necessarily incurred by the successful applicant from place of residence to the place of assumption of duty in South Africa, will be defrayed by the Administration provided that, if the contract is broken within one year of the date of assumption of duty the person appointed must refund to the Administration the full amount paid in respect of transport expenses and if the contract is broken within five years of the date of assumption of duty in the case of a Commonwealth citizen and six years in the case of a citizen of another European country, the person appointed shall refund to the Administration the pro rata share of the full amount above referred to in respect of the unexpired period (iii) The person so appointed will be offered permanent appointment during the term of contract but not earlier than three years from the date of assumption of duty or with effect from the conclusion of the contract, provided he has passed an examination in Afrikaans as second language, which examination shall not be lower than the standard required for the junior certificate examination of the Department of Education of this Province and provided further that his services and conduct during the period of contract are satisfactory and his state of health is such as will enable him to continue to discharge efficiently all the duties of the post in which he will be employed

Application must be made on the prescribed form, Staff 23, which is obtainable from the Staff Clerk, Room 102, South Africa House, Trafalgar Square, London, W C 2 The completed application forms must be addressed to the Director of Hospital Services, P O Box 2060, Cape Town South Africa, and must reach him not later than April 5, 1955 Candidates must state the earliest date on which they can assume duty

Applicants should preferably have desi experience in analogue computing or relate fields such as servo-mechanisms and negati feedback systems

Applications to Dept C P S 336 Strand, W C 2, quoting Ref S A 50C

THE RESEARCH DEPARTMENT OF leading industrial organization situated in south requires two graduates to undertake the pansion of an important research project nected with the raw materials of the indu The work involved, which offers ample scope initiative and imagination, will appeal to or chemists and biochemists who are intereste fundamental research on natural products an applying the results of this research to the cultural and manufacturing practices of the dustry Applicants must have a first- or sec class honours degree and some postgraduate perience would be useful, although not esser The appointments will be to the regular staff will be pensionable with starting salaries accor to age and experience within the range £70 £1,100 —Applications, giving full particulars be treated in confidence Box No T Haddon's, Salisbury Square, Fleet Street, E

TWO RESEARCH CHEMISTS APPL tions are invited from male graduates or pote graduates for the following posts in the fruit industry (i) Organic Chemist, preferably wit search experience in synthetic work (experien the isolation of substances from natural so would be an advantage) for pure and applie search in the carbohydrate field (ii) Ph Chemist or Biochemist for pure and applie search on problems of extraction from na products (involving enzymology) and of em cation in fruit products The successful cants for both positions will be required to on their own initiative and will be responsib the head of a small research department S will depend upon age, qualifications, and e ence in the range £600 to £800 The res department is attached to the factory and is ated in the Forest of Dean, applicants s therefore be willing to reside in a small co town Neither post carries exemption National Service —Applications, giving full d of age, marital state, qualifications and exper should be sent to The Personnel Man H W Carter and Co Ltd, The Royal F Factory, Coleford, Glos

---

ASSISTANT LIBRARIAN (FEMALE) quired for abstracting Applicants must ha degree in chemistry, good reading knowled French and German desirable, experienc library work or abstracting would be desi but not essential Permanent post, hours 9 to 5 30 p m Monday to Friday —Apply in in writing, quoting reference No 77 to Pers Officer, May and Baker Ltd, Dagenham, Ess

---

GRADUATE CHEMIST, PHYSICIST Chemical Engineer required by Chemical E eering Department in large paper making converting organization in S E England, to out process, investigation work and fundam research in paper making operation —Appl writing to the Personnel Officer, Albert E and Co Ltd Aylesford Paper Mills, Lark near Maidstone Kent, quoting reference C

LADY CHEMIST, GRADUATE OR H required for analysis of electroplating and solutions —Apply, Electro-Chemical Engine Co, Ltd, 161 Queens Road, Weybridge Su

GLAXO LABORATORIES LTD

Glaxo Laboratories Ltd invite applica-ions from graduates in one of the biological ciences for two posts at their Stoke Poges Research Laboratories The work of one of the posts involves research into bio-chemical and immunological aspects of the preparation of virus vaccines and the other he tissue culture propagation of viruses Postgraduate experience is a necessity for both posts

Those interested should write to Personnel Manager, Glaxo Laboratories Ltd, Green-ord, Middlesex

EXTILE CAREERS BRITISH NYLON nners Limited have several vacancies for young luates who will be given extensive technologi- training enabling them to become specialists his expanding organization The ideal quali-ion is a university degree in physics, engin-ig or textiles and candidates must have a ral bias towards applied work The selected lidates will be put to work under the super-n of experts and training will include a ough grounding in the manufacturing of yarns fibres and later in their development and essing to meet changing market requirements n successful completion of this training it is ided to employ these graduates in responsible ions on either technical development or ex-nental work or in the field of technical ser-

There will also be openings on the com-ial side of the business in which specialized vledge can be applied to the development of end-uses for the company's products A stic salary will be paid during training and vacancies offer exceptional opportunities to who are willing to work hard with a specific ct and in a climate of technical stimulation progress—Letters should contain full details academic achievements and a frank statement ambitions and inclinations, these should be essed to the Personnel Manager British Nylon iners Limited, Pontypool, Mon, and will be ed in strict confidence Candidates invited for view will be given a very clear impression of hat is implied by this new type of career

'ANTED BRITISH HONOURS GRADU- between 25 and 35 with sound knowledge applied mathematics (physics and statistics helpful) to share management of staff en-d in mechanized technical and scientific cal-tions Prospect of succeeding to management urity, enthusiasm, energy, adaptability and too academic a viewpoint essential Salary to £1,000, according to qualifications, quali- ability and experience—Apply before April 1955, to Managing Director, Scientific Com-ig Service Ltd., 23 Bedford Square, London, 1

QUIRED FOR PERMANENT POSITIONS Research activities in U S A Several men ing or soon to receive Ph D degrees in physi- organic or inorganic chemistry University ing essential Further academic or research ience desirable Applicants should be aged 30, eligible to emigrate to U S A Salaries nensurate with age and experience and ac-ng to U S A scales—Apply in writing, stat-country of birth and qualifications to E I Pont de Nemours and Co, Bush House, ych, London, W C 2

RESEARCH AND DEVELOPMENT

Courtaulds, Ltd, invite applications for the following vacancies in their Research and Development Laboratories Bocking Braintree, Essex Graduate Textile Technologist, age 27-32, with industrial experience, to work on textile dyeing and finishing Ref No D 61 Graduate Textile Technologist, to work on Research and Development in the field of textile manufacture Ref No D 62 Graduate Chemist, age 33 or less, for work on textile sizing Ref No D 63

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds, Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the appropriate reference number

ENGINEERS BRITISH NYLON SPINNERS Limited would be interested to receive applications from Engineers for several appointments which are to be filled in the near future The duties will be in applied experimental work and will be of exceptional interest to mechanical engineers who can make the most of opportunities for original thought and application Sound general experience n mechanical engineering is called for, with a bias towards experimental work, and one of the appointments requires a wide experience in instrumentation In every case a good university degree is a desirable qualification followed by an apprenticeship and at least three years' industrial experience Inquiries are invited now, whether or not candidates are immediately available, and the fullest information will be given to those asked for interview, such interviews carry no obligation, but will enable candidates to meet the company's Chief Engineer and his staff and to measure at first hand the technical interest and career prospects—Apply in writing to Personnel Manager Pontypool Mon

ALLEN & HANBURYS, LTD, WARE Herts, require Research Chemist, organic for Research Laboratories Candidates should have at least first- or second-class honours, or M Sc and should be under 30 Previous experience in organic synthesis desirable but not essential The position is permanent, progressive and superannuated Five-day week—Apply, Personnel Manager

GRADUATE CHEMIST, METALLURGIST or Chemical Engineer required to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel—Apply, Electro-Chemical Engineering Co, Ltd, 161 Queens Road, Weybridge, Surrey

THE RESEARCH LABORATORY OF THE British Thomson-Houston Co Ltd require a Graduate in Metallurgy or Physics to join an expanding group working on the strength of metals, with particular reference to high temperature properties—Apply, quoting reference HJ and stating age qualifications and experience to the Director of Research, The British Thomson-Houston Co, Ltd, Rugby

APPLICATIONS ARE INVITED FROM physicists with honours degrees or their equivalent, for posts in the research laboratory of the British Thomson-Houston Co Ltd. The work involves investigations of photo-conductive materials and devices, but previous experience in this field is not essential—Apply, quoting reference WNB, and stating age, qualifications and experience, to the Director of Research, The British Thomson-Houston Co, Ltd, Rugby

GRADUATE

required by the

NELSON RESEARCH LABORATORIES

Stafford,

who is fully conversant with Vacuum Techniques and preferably has some experience in the design and testing of electronic valves

This is a progressive position in new Laboratories set in pleasant surroundings

Please apply to Dept C P S, 336-7 Strand, W C 2, quoting Ref 308D

BRITISH NYLON SPINNERS LIMITED The Company's expanding activities will give rise to further appointments, during the next few months, covering a wide field of scientific endeavour Graduate scientists and textile technologists, whether available now or later, are invited to register their interest at this stage and where necessary exploratory interviews will be arranged involving no obligation The openings will cover a range of work including pure research, applied research, plant experimentation and the development of new manufacturing techniques up to full scale operation For men with suitable ability and inclinations there will be opportunities for specializing in the new advanced forms of technology arising with the advent of synthetic fibres and their textile applications Several of the appointments will be at a senior level and the company will welcome tentative inquiries from chemists, physicists and textile graduates, these will be treated in strict confidence, and should be addressed to the Personnel Manager, British Nylon Spinners Limited Pontypool, Mon

PHYSICIST OR METAL-PHYSICIST REquired for *X*-ray Laboratory (industrial radiography and crystallography) Scope for long-term research as well as technological applications Good university degree essential Candidates would be given encouragement to gain wide research experience and the seniority which this appointment is intended to carry—Applications to Personnel Dept, Hadfields Ltd, East Hecla Works Sheffield, 9

QUALIFIED YOUNG MALE CHEMIST, physically fit and having some knowledge of biology, required at Surbiton Laboratories of large Bakery Organization Duties will ultimately include visiting bakeries in all parts of United Kingdom Salary within range £550 to £675 per annum, depending on experience, but no previous industrial experience necessary Contributory pension scheme—Apply to Box 664, T G Scott and Son, Ltd, 143-147 Regent St, London W 1

T & H SMITH LTD HAVE A VACANCY in their works at Edinburgh for a qualified pharmacist or chemist, under 35 years of age, for interesting work in connection with the development and production of allergy preparations Superannuation scheme in force—Apply, giving full personal particulars to Works Director, T & H Smith Ltd Blandfield Chemical Works, Wheatfield Road, Edinburgh, 11

This vapour pump was specially designed to provide fast pumping speeds so essential to many large research installations and to meet the exacting requirements of commercial applications where rapid operation cycles are necessary without the need for large backing pumps and lines.

IMPORTANT FEATURES OF THE 903B VAPOUR PUMP

- ★ Integral "Booster-type" third stage permits high speeds against backing pressures as high as 0 5 mm Hg without large diameter backing lines or expensive backing pumps.
- ★ Combines high effective pumping speeds and backing pressure performance with less than normal heater inputs
- ★ Water-cooled baffle valve maintains highest practicable pumping speed with effective baffling and the operational advantages of an isolation valve

SCALAMP FLUXMETER

Excellent design and the selection of the most suitable materials are combined to give this new FLUXMETER a truly outstanding performance. The drift rate with a search coil of 10 ohms or less is 0·1 per cent. A two speed "return-to-zero" control is fitted enabling measurements to be made with rapidity and ease. A spirit level and levelling feet facilitate setting-up and the automatic and manual coil clamps safeguard the suspension in transit. The illumination of the lamp bulb is effected either by an external 4-volt battery or by mains supply through the built-in transformer. Two search coils of mean diameter 1 cm and of area turns of 10 or 100 cm.^{2} are available.

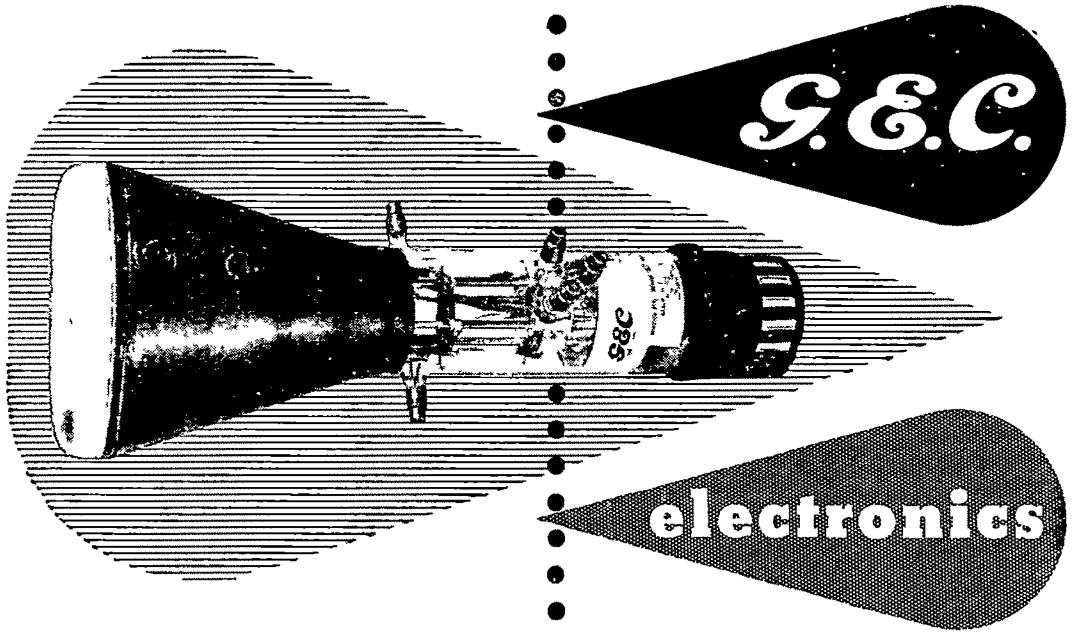
FRESHWATER ROAD CHADWELL HEATH, ESSE



Special purpose Cathode Ray Tubes
for Research and Industry

A range of cathode ray tubes is available for use in specialised applications such as the observation and recording of high speed transient phenomena, where the high capacitances and other limitations of the usual type of instrument tube would result in distortion or complete suppression of the trace

Typical applications of these special tubes include high voltage cable testing insulator overload and breakdown testing, cable fault finding by quasi-radar technique and the investigation of high voltage switching phenomena.

They are also suitable for use in laboratory oscilloscopes

Brief details of some of the more popular types are given below The tubes are of the all-electrostatic type, with heater ratings of 4V, 1 0A (approx)

401 CAHA
408 CAHA
Rating
Va3 (max) 1 5kV
Vp d a 3 3 5kV
Sx (av) 0 090mm/V
Sy (av) 0 100mm/V
Screen 401 CAHA Green-visual
408 CAHA Killed blue—photographic
Base B9G (pressed glass)

4cm dia high vacuum monitor tubes with one stage of post deflection acceleration For use in laboratory oscilloscopes, multi-channel strain-gauge recording equipment, etc.

908 BCC
Rating
Va3 (max) 10kV
Sx (av) 400/Va3 mm/V
Sy (av) 750/Va3 mm/V
Screen Killed blue—photographic
Base: B12D

A 9cm dia flat screen high speed recording tube with a low capacitance deflecting system The connections to the plates and final anode are brought out through side-arms Writing speeds of the order of 30,000 km/sec are possible, and transients of the order of 10^{-9} sec may be recorded

908 CARA
Va3 4kV
Vp d a 8kV
Sx (av) 0 085 mm/V
Sy (av) 0 12 mm/V
Screen Killed blue—photographic
Base B12D

A 9 cm dia flat screen high speed recording tube with one stage of post deflection acceleration For use where the special features of the 908 BCC cannot be employed to full advantage The Y plate connections and final anode are brought out through side arms

1601 ABC
Va3 (max) 5kV
Sx 660/Va3 mm/V
Sy 1100/Va3 mm/V
Screen Green—visual
Base B12D

A 16cm dia flat screen high speed oscillograph tube The construction is of the low capacitance type with the deflector plates and final anode connections brought out through side arms

1608 BCCA
Va3 (max) 3 5kV
Vp d a 3 (max) 10kV
Sx (av) 0 15mm/V
Sy (av) 0 27mm/V
Screen Killed blue—photographic
Base B12D

A 16cm dia flat screen tube of similar low capacitance construction as the 908 BCC, but with three stages of post deflection acceleration This tube will achieve similar writing speeds and recording periods as the 908 BCC, and is recommended for use where the deflecting potentials available are limited

Alternative screens are available including long after-glow and white and blue aluminised types

Other types of special tubes are available including
Double gun tubes Storage tubes
Television monitor tubes
Conical deflection systems tubes for radial time bases Monoscopes, etc

Write to Osram Valve and Electronics Dept for full technical details

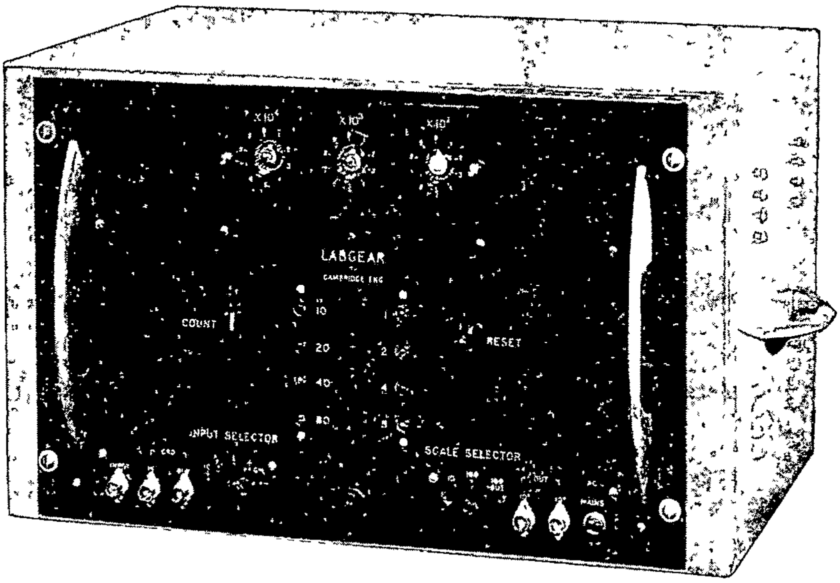
FAST SCALING UNIT

CATALOGUE No. D.4100



A five decade scaling unit of improved design particularly suited to use with scintillation and proportional counters

Price £148 in U.K. Delivery from stock

Features:

- Fully electronic scale of 100,000, or 100,000,000 with external Dekatron Register D 4019/V
- Zero reset of entire recorded count
- 10^2, 10^3, 10^4 and 10^5 count pulse for use in conjunction with Dekatron Automatic Timer D 4102 in " time-per-unit-events " applications
- Maximum steady counting rate 200,000 pulses/sec
- Power outlet for pre-amplifiers.
- Calibrated discrimination and paralysis time

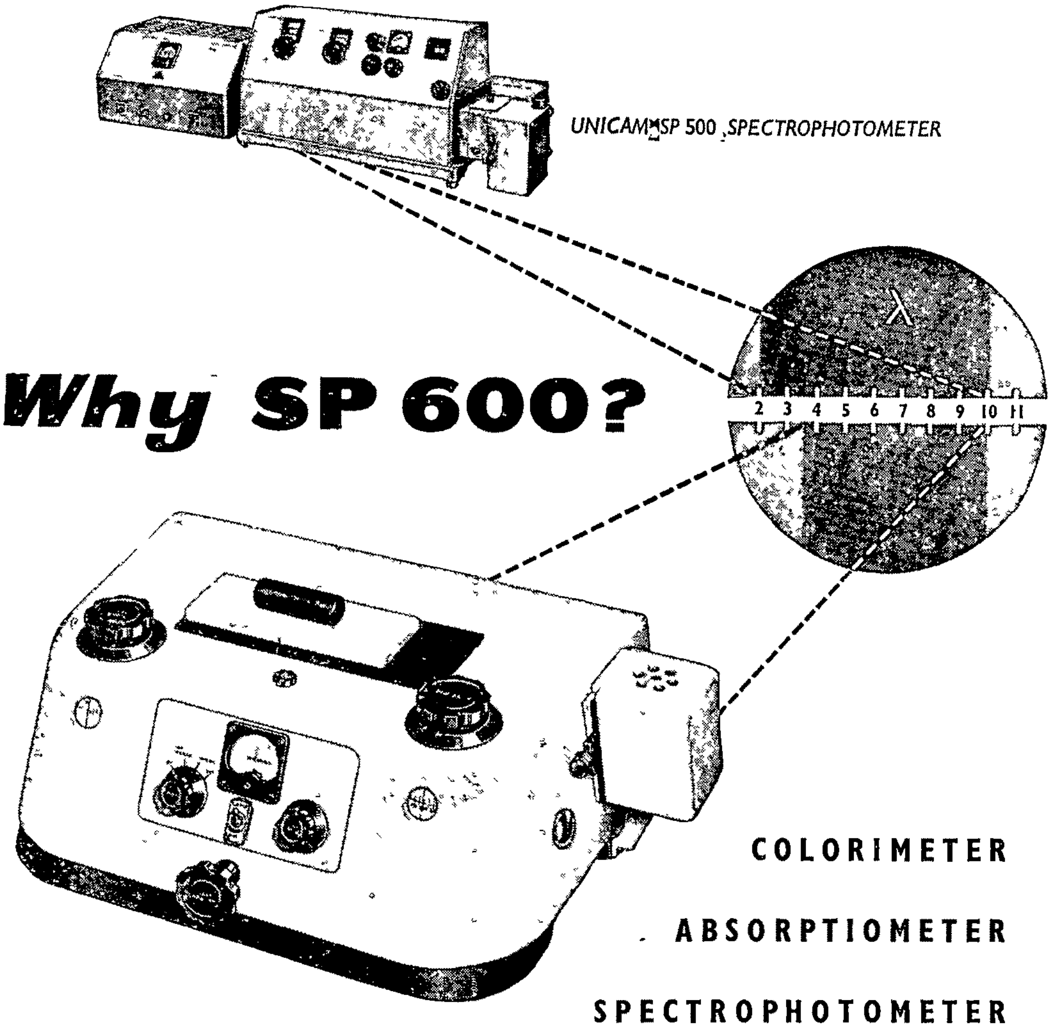
ILFORD LIMITED ILFORD LONDON

Why SP 600?



COLORIMETER

ABSORPTIOMETER

SPECTROPHOTOMETER

In every way the SP 600 Spectrophotometer makes an ideal complement to the familiar SP 500 There are analytical problems (in the field of metallurgy, for example) which demand an instrument capable of precise absorption measurement at carefully selected wavelengths, but for which ultraviolet equipment is not necessary The SP 600 is designed to provide exactly these facilities

The dispersion of the glass prism and the high quality optical system give a resolution unobtainable with filters and the electronic detector-amplifier makes the instrument exceptionally sensitive. It is robust, easily operated and moderately priced.

Arrangements can be made for a comprehensive test in your own laboratory, without obligation. Please write for details.

Instruments for Research and Industry

Direct Reading pH Meter

A robust and exceptionally stable mains-driven instrument which is being widely used by leading firms, both at home and abroad The 6-inch mirror scale meter may be read to 0.05 pH, and the normal zero stability of the instrument is ± 0.02 pH. There are two pH scales: one reading 0–14 pH and the other giving a coverage of 7 pH over any part of the scale. A millivolt scale is also included and automatic temperature compensation is provided from 0° to 60° C.
A complete range of laboratory and industrial electrode systems is available for use with this instrument.

MAN-POWER FOR COLONIAL DEVELOPMENT

THE Queen's speech at the opening of the new session of Parliament on November 30 indicated he Government's intention to prolong the Colonial evelopment and Welfare Acts and to increase the nds available under them, as well as its continued pport of the Colombo Plan The debate on the peech in the House of Commons on December 3 ntred on Colonial development, and Mr. A. Lennox-oyd, Secretary of State for the Colonies, said that e hoped to introduce a further Colonial Development nd Welfare Bill at an early date which would provide additional sums for that purpose for 1955–60 e could not give any figures, as the Bill was not in nal form, but there would be an overlap of a year etween the money voted by the last Act and that hich would be provided under the new Bill The olonies have already been asked to draw up their lans for 1955–60, indicating their priorities and the xtent to which priorities can be met out of their wn resources.

Mr. Lennox-Boyd pointed out that expenditure on olonial development has been rising steadily and now running at the rate of about £110 million a ear Excluding some major projects and the work the statutory corporations and other public bodies, out £500 million is now involved in Colonial delopment, of which about half is coming from the cal resources of the territories, about one-third from ternal loans, and one-sixth, or about £14 million year, currently, from the Colonial Development and elfare Fund. Some 43 per cent of the latter monies spent on social services, 10 per cent on research, 6 per cent on surveys and censuses, nearly 20 per nt on economic purposes (mainly agriculture), and 5 per cent on communications.

Reviewing this expenditure, Mr. Lennox-Boyd rticularized the expenditure of £14 5 million on blic health and referred to the shortage of medical en and nurses in many parts of the world Of the 3 million expended on education, between £7 and million has gone on university education and about 8 million on technical and vocational training, and r Lennox-Boyd welcomed the plea which Mr. mes Griffiths had made for a greater development technical education. The more we can do to courage technical education, he said, the better shall serve the interests of the Colonial territories enabling them to live a full and complete life d meet on more even terms the problems of the odern world. He also welcomed the dramatic exnsion in university facilities since the Second orld War and, referring to the importance of the velopment of housing and water supplies, paid a rm tribute to an imaginative experiment initiated Sir Edward Twining among the Mahoude in nganyika. He promised to look into a suggestion ade by Mr Griffiths in regard to the relationship tween the Colonial Development Corporation and lonial Development and Welfare Funds, and he also emphasized the importance of encouraging the development of craftsmanship.

Replying for the Government on this debate, the Under-Secretary of State for Commonwealth Relations, Mr. D Dodds-Parker, dealt more particularly with the Colombo Plan, to which over six years Great Britain will be contributing about £300 million, of which £252 million represents the release of sterling balances. To India, Pakistan and Ceylon, these releases will amount to about £42 million a year, including £5 million for steel expansion in India and the same amount for the Sui Gas Transmission Company in Pakistan, while grants and loans to Malaya and North Borneo last year amounted to about £12 5 million By June 1954 the United Kingdom had agreed to supply about £840,000 for equipment for research institutions, laboratories, and railway training, while under the Colombo Plan Technical Co-operation Plan alone it had found 621 training places by June 1954 and had offered the services of 155 experts, of whom 111 were accepted.

Mr Dodds-Parker estimates that altogether Great Britain is spending about £200 million a year on overseas aid. This includes £1 33 million in support of the Specialized Agencies, £650,000 on the Technical Assistance Programme of the United Nations (to be increased to £800,000 this year), £18 5 million on Colonial development and welfare, £5 5 million on the Colonial Development Corporation, £23 5 million on Colonial loans as well as £10 million each to the Governments of Southern Rhodesia and New Zealand, £10 million to Pakistan in export credits and £400,000 for technical aid under the Colombo Plan. The Capital Issues Committee authorized private capital issues of £40 million while, through the World Bank, we released to India and Pakistan, in 1954, £10 million out of the £60 million for Commonwealth development spread over six years, and £42 million was released from sterling balances. The stress laid by Sir Arthur Braithwaite on the necessity for capital investment and the importance of providing adequate incentives was welcomed by Mr. Dodds-Parker He said that the Government is doing its utmost to see that priorities are put in the right order. He stressed also the general shortage of qualified and experienced technical and scientific personnel, and both he and Mr Lennox-Boyd emphasized the importance of the Colonial Territories themselves making the maximum use of their own resources in financing development. The Colonial governments have recently been informed of the Home Government's agreement in principle, and, subject to a review of the individual circumstances of each territory, to a small part of their currency funds, amounting to £365 million, held in London in the form of investments in United Kingdom issued securities, including some Colonial stock, being transferred into locally issued securities.

One point which was made by Sir Arthur Braithwaite and which, in slightly different form, was stressed by Mr. Dodds-Parker, puts in its proper perspective the value of the welfare work among overseas students of the British Council Sir Arthur, in connexion with civil engineering constructional work, stressed the value of bringing people from the Colonies to Great Britain for industrial, as well as academic, training Mr. Dodds-Parker pointed out that many students come to Britain at their own expense. He was impressed, in his recent visit to Asia, with the number of people who wished to send their children to Britain for higher education, and he thought that this is a continuing contribution which Britain can make.

There are now more than 8,000 Colonial students in Britain, some 3,500 of whom arrived during 1953. Nearly half of them are West Africans, but practically every Colonial territory is represented These figures alone emphasize the importance of the work of the British Council among overseas students, which, since 1949, has been met mainly from Colonial Development and Welfare Funds, with contributions from both the Foreign Office and the Commonwealth Relations Office also, since under the scheme initiated on January 1, 1950, the British Council is responsible for extending the welfare facilities for overseas students generally, as well as for maintaining hostels and other services for the welfare of Colonial students. Overseas students in the United Kingdom are now estimated to number about 25,000 compared with 10,000 in 1948, and although of the 3,647 students met by the British Council on arrival during 1953, 3,258 came from British Colonial territories and only 248 from foreign countries, accommodation of some kind at one time or another was found for 2,270 students from foreign countries during the year.

The latest report from the British Council*, which attributes the rapid increase in the number of overseas students to the increase in grants for study in British universities and technical colleges, and also to new schemes for training artisans in British industry and commerce arising directly out of Colonial development, reviews at some length the working of this scheme during the past four years, and the measure of its success in achieving its objectives. During that period, the Council's staff have met on arrival nearly 12,000 overseas students, more than 10,000 from Colonial territories, and confidence is expressed that the procedure devised for the purpose, in consultation with the Colonial Office and with the co-operation of the Customs and Immigration Authorities, has worked well and that a Colonial student is now helped through the inevitable formalities with sympathy and efficiency. It would, however, be of advantage if these reception arrangements could be expanded to meet the needs of other students from within and without the Commonwealth.

Most overseas students, on first arrival, go to London, where temporary lodging on arrival was found last year for some 6,500 students, nearly 5,500 from the Colonies. In 1953 a new hostel was opened in Lancaster Gate, London, primarily to meet this need, and it has now been recognized by the Colonial Office that such a transit hostel will be essential for som
time to come. It soon became obvious that hostel
for Colonial students were essential so long as th
number continued to increase, with segregation i
an undesirable type of boarding house as the onl
alternative. Accordingly, the policy of reducing th
number of hostel beds envisaged in the 1948 dis
cussions was abandoned. the Newcastle an
Edinburgh hostels were reprieved and improve
or extended, an enlarged and improved hostel fo
women students opened in London, while that a
Lancaster Gate also provides some permanent bed

Besides this hostel policy, which has also mad
Hans Crescent the centre for Colonial studen
activity in London, the Council has found permanen
accommodation in private lodgings for more tha
7,000 students, some 3,700 of them from the Colonie
Nearly 6,500 students have attended its vacatio
courses, for each set of which more than a thousan
applications are received, and whereas in 195
students from foreign countries attending thes
courses outnumbered Colonial students by more tha
four to one, in 1953, Colonial students were in exces
by three to two. The value of these courses, like tha
of the various surveys and study visits, which ar
arranged by the Council but paid for mainly by th
students themselves, lies in the fact that they enabl
students from different parts of the world to live fo
a time together and to get to know one anothe
and make it possible for them to see something o
the practical sides of their subjects of study, to vis
different parts of the United Kingdom and to mee
a wide cross-section of the British public.

In London, and in the areas outside London wher
the Council has staff, there is either a centre fo
overseas students organized by the Council, or th
Council is associated with an international club mai
tained for a similar purpose. Such centres provid
a place where overseas students can meet each oth
and to which they can invite their British friends
and by enabling the Council's staff to get to kno
students individually, they also facilitate the arrang
ment of suitable hospitality for students in Britis
homes. The activities of the centres are particular
useful in areas where there are large numbers
industrial trainees or non-university students.

London, however, presents problems which ha
never been satisfactorily solved, although some
the experiments in London boroughs have succeede
to an extent which has seriously overtaxed the sma
staff available In 1953, the Council issued mo
than 9,500 invitations to overseas students to me
British people in their homes, or in societies or club
and some 1,700 students made new friends in this wa
Other organizations are doing similar work, but t
pressure on the British Council's Overseas Stude
Centre in London is such that the membership cou
be increased several times if premises and staff we
available, it has therefore been necessary to lim
membership to 1,200 students. On the whole, t
report suggests that the recommendations of 19
which set the scheme in motion are being ful
implemented so far as Colonial students are co
cerned, although much remains to be done to me

---

* Report of the Work of the British Council for the Year ended 31st March, 1954 Pp v+105. (London British Council, 1954). 2s. 6d

the needs of students from the Middle East and South-East Asia.

There is, nevertheless, no room for complacency as to the work which the British Council is already doing among Colonial students, viewed simply as a complementary factor in Colonial development and welfare, or as to the desirability of increasing its scale and of supplementing it by private effort. If the comments in the debate on November 30 did not sufficiently bring out the bearing of such work on the effectiveness of programmes for technical assistance in the under-developed countries, the broadsheet which was issued almost simultaneously by Political and Economic Planning, "Students from the Colonies" (No 374, November 29, 1954), although only a preliminary account of some of the difficulties which such students encounter in trying to understand the British and to adjust their ideas to life in Britain, gives a sober warning of how much remains to be done. The picture it reveals of frustration, nostalgia, disillusion and optimism, the evidence adduced of unhappiness, discontent and misdirection is disturbing, and not the less so because the tone of some students' criticism of their reception betrays a lack of drive and adaptability that speaks poorly for their ability to participate effectively in Colonial development

Like the comments on this subject in the debate and the review in the British Council's report, this broadsheet indicates the need for some hard thinking matched by constructive action by all bodies concerned with the welfare of overseas students, by the university authorities and by the well-disposed public, whose private hospitality could probably do most to make these potential leaders of the under-developed and Colonial territories firm friends of Britain. That both Government spokesmen should have recognized something of this is to the good, and there should be no need to fear that adequate money will not be forthcoming for the purpose from Colonial Development and Welfare Funds. Government action can only go a certain way, and beyond this—quite apart from the indispensable influence which private bodies and individuals can exert—it would be helpful if there were less disposition to make Colonial development and welfare a matter of party politics.

WAR-TIME RADIOBIOLOGICAL RESEARCH

Biological Effects of External Radiation

Edited by Dr Henry A. Blair. (National Nuclear Energy Series—Manhattan Project Technical Section. Division 6—Volume 2.) Pp xvii+508. (London: McGraw-Hill Publishing Company, Ltd., 1954.) 56s

THIS volume, edited by H. A. Blair, is one of the sixty-odd of the National Nuclear Energy Series. The general preface states that these volumes will attempt to cover completely what has been 'declassified' of the results of research done in the many divisions of the Manhattan Project and the Atomic Energy Commission in the United States. This one presents the results of the major part of the work done during the war period at the University of Rochester on the biological effects of X-radiation and, in collaboration with the Biochemical Foundation of Newark, on the effects of fractionated neutron irradiations

The major part of the material has been already published in scientific periodicals or was embodied in internal reports. While for the history of the subject there is no doubt that a record of these war-time researches will be useful, it is rather difficult to assess the immediate value of a volume which reports researches some ten or more years old, and which many of the authors have put into the present form when their interests were elsewhere.

The volume is divided into three parts Part 1 deals with the effects of single doses of X-irradiation applied to the whole body. Part 2 deals with chronic exposure of the whole body, and Part 3 with the effects of fractionated doses of fast neutrons Presumably, most of the work had as its object information both as to 'tolerance' doses for those exposed to radiation during their work, and as to the effects on individuals exposed to sudden single large doses as a consequence of acts of war It follows that, with the exception of one of the papers—by Spencer and Stern on the relation between mutations and X-ray dose at very low levels—the content of the volume has not much general interest for the biologist, though it has for the radiologist

The paper by Spencer and Stern is one of the first which attempted to establish the genetic effects of radiation at levels so low as merely to double the background. It is therefore one of the first papers to give experimental support to the extrapolation that in respect of their genetic effects there is no lower threshold for radiations, a matter which is even now taken lightheartedly by many.

Among the other papers the biologist not directly interested in radiobiology will find a number of interesting, though disconnected, facts For example, the lethal mean dose of X-rays is about 200 r for a guinea pig, about 300 r. for a dog, 500 r for a rhesus monkey, more than 600 r for a rat and a hamster, and about 800 r. for a rabbit It would be most interesting to find what regularities there are in these species differences between mammals Another interesting point, though well known, is the enormous difference in sensitivity of different tissues of one and the same animal—this not only in the severity of the injury but also in the speed at which it first appears, reaches its maximum, and may gradually vanish For example, in the rat 550 r. produce histologically visible injury of the bone marrow fifteen minutes after irradiation, with complete recovery in forty days. In the testis the damage appears at six hours and recovery begins only after forty-two days

Injuries to finger-ridge detail, both experimentally produced in monkeys, and detected in a sample of professional groups liable to irradiation (radiologists, orthopædists and dentists), reveal characteristic effects. 68 per cent of 1,033 radiologists, 55 per cent of 185 orthopædists and 40 per cent of 503 dentists showed detectable finger-ridge changes as compared with 1·8 per cent in a sample of 1,850 controls.

A number of other interesting findings of this kind are dispersed throughout the volume. For example, a chapter by R. D Boche reports the effect of chronic X-irradiation on the length of life. There seems to be evidence that even as low a dose as 0·1 r. per day may shorten the expectation of life of rats No doubt by now experiments of this kind will have been repeated and vastly extended. It is essential for the peaceful development of atomic energy that knowledge of this kind should be made available without delay G PONTECORVO

APPLIED STATISTICS

Statistics for Technologists

By C G. Paradine and B H P Rivett. Pp vii+288 (London English Universities Press, Ltd, 1953) 25*s* net.

Statistical Methods in Electrical Engineering

By Dr. D. A. Bell Pp. viii+175 (London Chapman and Hall, Ltd, 1953) 25*s* net.

ANY book on statistical methods for a special group of readers is vulnerable from two directions—its development of the subject itself, and its suitability for the class of reader at which it is aimed.

"Statistics for Technologists" develops fairly logically those parts of the theory of statistics which its authors include (Unfortunately, work-study teams wrestling with congestion problems will find no help here.) The approach could be improved, however, by more explanation of the general principles involved in significance testing The authors are obliged, in their chapter on sampling inspection schemes, to mention briefly the two types of error involved in significance testing, and it would be helpful if some more detailed discussion of these underlying ideas could be inserted before the demonstration of particular tests

It is perhaps a general criticism that although most engineers and scientific workers could comfortably digest the mathematics used, the basic statistical ideas, which are more difficult for the non-statistician to grasp, merit a little further explanation Also, the way in which the examples are used to illustrate the text is not entirely satisfactory in a book specifically for technologists. Although many of these examples come from technological sources, on the whole they lack the circumstantial information which would illustrate to the student the sort of difficulties involved in practical application It may be argued that applying theory requires only common sense, but common sense is greatly helped by the experience of others With these reservations, this book is an adequate introduction to statistical methods for the mathematically minded reader, whether technologist or not.

In contrast, "Statistical Methods in Electrical Engineering" can scarcely be considered as in any way satisfactory in its present form The result of narrowing the topics discussed to the field of electrical engineering has been to destroy continuity in the treatment of statistical methods Only in the last two chapters, where the author deals with electrical fluctuations and information theory, does the book become at all convincing The looseness of construction of the previous chapters can only result in confusing the reader who does "not wish to embark upon a statistician's course of study" For example, the author needs to use Bayes's theorem to derive the expression for the information content of a signal He therefore discusses Bayes's theorem in his first chapter on probability, and states that it is controversial, but the quotations from Fisher and Jeffreys do not make it clear that it is the assumptions necessary to apply Bayes's theorem that caus disagreement, nor does he state what these assumptions are. Again, the use of the word parameter t describe the sample variance and "Student's *t*" wi be irritating to the statistician and confusing to th non-statistician. It has perhaps even confused th author, for he makes the statement that "the rando error of the answer deduced from the total of (N observations is approximately $\sqrt{N}$ times less than one relied on a single experiment (*actually* $\sqrt{N-}$ which tends to $\sqrt{N}$ when N is large)". The omissio of any discussion of congestion theory is even mo noteworthy in this book than in the previous on for the greater part of the theory was developed b Erlang and his successors specifically for electric engineers concerned with telephone exchange problems, and an up-to-date definitive text has still t appear Finally, it is surely superfluous in th appendix listing statistical tables to devote thre separate sections to the different forms in which th normal integral is tabulated F DOWNTON

AUTOMATIC DIGITAL CALCULATING MACHINES

Automatic Digital Calculators

By Dr. Andrew D. Booth and Dr. Kathleen H V Booth. Pp vii+231+4 plates (London Butterworths Scientific Publications, 1953) 32*s* net.

AUTOMATIC digital calculating machines, thoug increasing in number and variety, are still no very numerous and are still news, rather sensationa in the public mind The idea that a calculatio involving many digits can be performed in a matte of milliseconds is one that implants despair i certain temperaments, and breeds a curious brand o mechanical mysticism in others The remedy fo such reactions is to read a straightforward an objective book on the historical development an present status of such calculation, and for th purpose the book under notice seems admirable. Th authors have the practical and theoretical qualifications, experience with different types of computin machine, enthusiasm for the subject, and a clear an unassuming style of exposition

The historical introduction is brief, so far as i refers to dates earlier than 1940 The initiator is, o course, Charles Babbage, whose wilful face stare from the pages of any history of calculation, a ma whose imagination was exact regarding the possibilities of machine calculation, but far ahead of th mechanical resources available in his own age, a man unable, however, partly through temperament to retain the sympathy of the government of th time or the continuation of financial support. Hi ambitions foundered in 1842, so that it was almos a century before the coming of electronic technique enabled those dreams to be more than realized. Th third chapter of this book summarizes the rapi advances that took place between 1940 and 1950

Several chapters of a descriptive kind follow, i which the technicalities of input, output, control an the various operations, addition and subtraction multiplication, division and others of miscellaneou nature, are detailed in the clearest manner wit excellent diagrams Chapters on storage follow, an here unfortunately the word 'memory', with it misleading anthropomorphic associations, seems entrenched in the literature and hard now to dislodge

Lastly, there are chapters on coding and coded routines, illustrated by square root, interpolation and the like, and that question of mechanical translation from one language to another which aroused newspaper controversy and misunderstanding not long ago

Concluding sections deal with the "playing of games" by machines, and "machine learning and intelligence" Here the reviewer, having followed so far with interest and profit, found himself in mental opposition to such phrases as "conditioned reflex" of a machine, or its "awareness" But perhaps these pages of Erewhonian speculation are merely a fanciful epilogue In any event, they do not detract from the value of a very good and compact book, rather costly for its 240 pages, but probably indispensable in the growing literature of texts dealing with electronic calculating machines

A C AITKEN

ENZYMES, GENES, VIRUSES AND BACTERIA

Annual Review of Microbiology

Edited by Charles E. Clifton, in association with Sidney Raffel and Roger Y Stanier Volume 8, 1954 (Stanford, Calif Annual Reviews, Inc , 1954) 7 dollars

THE need for regular, critical surveys of recent work which are something more than lists of references with titles, but at the same time less detailed than articles in the standard review periodicals or "Advances" series, is uncontested Indeed, publications in the "Annual Review" series have become an essential aid to biological research and are a partial answer to the appalling quantity of scientific literature which now faces the research worker

The extent to which recent work can be subjected to reasoned criticism in these series is severely limited by lack of space It is, however, variable and therefore apparently left in some degree to the discretion of contributors It would be unfortunate if the opportunity for comment were subjected to any further restriction Even at the risk of a more individual approach and the relegation of some papers to a bibliographical list printed as an appendix without comment, a review article should aim at critical assessment of at least some of the work done on a particular subject

One example, in this volume, of what can be done is the comprehensive and extremely useful review on "Genetics in Micro-organisms" by S Spiegelman and D E Landman This is a real *tour de force*, with 481 eferences cited in fifty-six pages of condensed, almost telegraphic, English It is readable, but exhausting

In general, the articles are widely and fairly distributed among different fields general microbiology, 5 , bacteriology, 6 , viruses, 5 , immunology, , protozoology, 2 , and mycology, 1. Selection for omment is always apt to be misleading, and must be taken largely as an indication of the reviewer's particular interests

The most striking impression obtained is that of he remarkable and fascinating advances made in he study of bacteriophage and in bacterial genetics Workers in other fields must envy the way those studying phage reproduction and genetics have broken through into the open during the past five years This is clearly illustrated by a short and excellent review, by E A Evans on "Bacterial Viruses", which is easily assimilated, even by those unfamiliar with the subject

The important recent advances made in the study of viruses grown in tissue cultures (with special reference to poliomyelitis virus grown on human or monkey cell homogenates) have been reviewed in a very helpful and thoughtfully written article by J F Enders

Among other articles of special value and interest is one by A H Coons on "Labelled Antigens and Antibodies". Fluorescent, iodinated, coloured, chemically marked and isotopically labelled proteins are being used on an increasing scale in the study of antibody formation C. L. Oakley has written a characteristic review on "Bacterial Toxins" where he describes in some detail the intricate, immunological analysis of culture filtrates containing several different, physiologically active proteins He suggests the term 'soluble bacterial antigens' as a substitute for 'toxins'. One can sympathize with some of his feelings , but, if there is going to be a change, why not move straight towards a biochemical basis of nomenclature ? It should at least stimulate more badly needed biochemical work on the characterization of these substances

In microbial metabolism the importance of coenzyme A is becoming increasingly recognized, as emphasized by J. R R Campbell in an article which includes four pages on recent advances in the study of adaptive enzymes. W. W Umbreit devotes fourteen pages to "Mechanisms of Antibacterial Action" in an article which is useful largely in indicating how extraordinarily little is known about these mechanisms. His implication that the mode of action of penicillin and streptomycin is now more or less understood is—in spite of some important work on streptomycin (particularly by himself and colleagues) —somewhat misleading

In a review of "Changes in the Host Flora induced by Chemotherapeutic Agents", E McCoy stresses the increasing proportion of bacterial strains found resistant to penicillin or streptomycin (especially in hospital infections, where it can be as high as 80 per cent) and more recently, to chlor- and oxy-tetracycline and even to erythromycin. So far, instances of cross-resistance are not numerous , but the outlook is not encouraging

There are two articles on bacterial cytology a useful review by S Mudd on the "bits and pieces" of bacteria (flagella, capsules, cell walls, mitochondria, microsomes, etc) , and a more difficult article by E. D DeLamater on "The Bacterial Nucleus" It is unfortunate that a rather bitter controversy on the mechanism of nuclear division (and other matters) should have obscured some of the genuine advances made in this field

It is difficult not to be impressed by the almost overwhelming advantages offered by work on micro-organisms in the pursuit of nearly every kind of biological problem It would be understandable if impatient physiologists, biochemists, virologists and geneticists now working with plants or mammals were tempted to drop their present occupation and concentrate for ten years on analogous studies on a convenient, non-pathogenic species of bacterium in order to make some rapid discoveries which would almost certainly be immediately applicable to their original research problems

M R POLLOCK

COLONIAL RESEARCH IN THE BRITISH COMMONWEALTH

THE first annual report of the Colonial Research Committee was published in May 1944 as a slender Command Paper of eleven pages The second annual report was issued in August 1945, along with those of the Colonial Products Research Council and the Colonial Social Science Research Council, under the title "Colonial Research, 1944–45", a Command Paper of 31 pages Now, "Colonial Research, 1953–54" is a substantial publication of 278 pages* Besides the annual reports of the three original bodies, it contains the ninth annual reports of the Colonial Medical Research Committee and of the Committee for Colonial Agricultural, Animal Health and Forestry Research, the seventh annual reports of the Colonial Insecticides, Fungicides and Herbicides Committee and of the Colonial Economic Research Committee, the Colonial Fisheries Advisory Committee's annual report on fisheries research for 1953–54, and the reports for 1953–54 of the Tsetse Fly and Trypanosomiasis Committee and of the Director of the Anti-Locust Research Centre, as well as reports on miscellaneous matters not covered by the reports of the specialist advisory bodies

All these reports include lists of reports and other publications issued during the year , but neither in the brief report of the Colonial Research Council nor elsewhere is there, however, any attempt at a considered conspectus of the work of these ten specialist bodies and its bearing on Colonial development and welfare work generally and in relation to British resources and research activities as a whole The nearest approach to such a survey is provided by the list of research schemes approved under the Colonial Development and Welfare Acts in 1953–54 and in the comments of the Colonial Research Council on those schemes There may well be some administrative convenience in publishing these annual reports *en bloc* , but the title is something of a misnomer unless it is accompanied by some general survey or summary directing attention to the most important implications for Britain's commitments in research, for Colonial development and welfare and for technical assistance to the under-developed areas Such a survey is now well overdue and in its absence less than justice is being done to the British effort

The forty-two new schemes and forty-nine supplementary schemes made during the year, involving grants totalling £728,510, brought the net expenditure and commitment from Colonial Development and Welfare Funds since 1940 to about £12 million at March 31, 1954 Of the gross allocation of £13 million, about 33 per cent has been for agricultural, animal health and forestry schemes, 15 per cent for medical research, 12 per cent for fisheries research, 10 per cent for tsetse fly and trypanosomiasis research, 9 per cent for social science and economic research, 8 per cent for insecticides research, 5 per cent for research sponsored by the Colonial Products Research Council, 3 3 per cent for anti-locust research and 4 6 per cent for miscellaneous schemes, including building and road research About 40 per cent has been for schemes to benefit the East African territories, 19 per cent for the West African group, 10 pe cent for the South-East Asian territories and Hong Kong, 8 4 per cent for the West Indian Colonies British Guiana and British Honduras, and 5 6 pe cent for the Central African territories.

Of the major schemes approved during the year the largest are £123,743 for the establishment of the West African Council for Medical Research , £110,00 for continuation of research at the East Africa Veterinary Research Organization , £66,984 for the maintenance of the West Indian Institute of Socia and Economic Research , £44,809 for control o malaria in the hyper-endemic area of Taveta-Parc East Africa , £31,330 for the continuation of suga technology research at the Imperial College o Tropical Agriculture, Trinidad , £20,492 for researc in Jamaica into the 'unknown' disease of coconut and Panama disease of bananas , £18,750 for th preparation at the Royal Botanic Gardens, Kew, o the "Flora of Tropical East Africa" , £16,000 for th establishment of the malarial unit in East Africa £16,022 for investigation into the control of filariasi in Fiji by insecticidal methods , £14,915 for researc in Malaya on virus and other diseases transmissibl from animals to men , £14,780 for the establishmen of a Fungicide Research Unit in West Africa , £14,30 for banana-breeding research in Jamaica , £13,52 for the establishment of a pool of Colonial soil surveyors , £12,290 for the expansion of the Veterinar Research Laboratory, Vom, Nigeria , and £12,25 for the maintenance of the West African Institute fo Trypanosomiasis Research

The eleventh annual report of the Colonial Product Council, which on January 1, 1954, replaced the Colonial Products Research Council and has assumed responsibility for the general supervision of the Colonia Products Laboratory (formerly the Colonial Product Advisory Bureau), notes that eighty investigation were carried out in the Laboratory and 786 inquirie handled. Investigations on West African groundnut continued, with particular reference to the effect o insect attack on quality An improved technique fo assessing insect infestation in maize was devised fo use in Colonial territories, and African methods o preparing gari from cassava are being studied wit the view of mechanizing the process Good progres is reported in building up a reference collection o photomicrographs of fibres obtained from botanicall authenticated plants Some experimental work wa carried out on the chemical retting of cotton stal fibre and *Hibiscus cannabinus* with the view of determining which of the commoner and cheaper chemical could be used Pulped by the sulphate process, bata wood (*Albizzia falcata*) from the Federation of Malay gave a pulp comparing very favourably with coniferous sulphate pulps, and a mixed sulphate cook o three species of timber from Kenya gave a bleache pulp suitable for incorporation in printing or writin papers Good-quality pulp suitable for high-strengt papers was obtained from ribbons of *Hibiscus cannabinus*, obtained in work in Nigeria on the mechanized production of stem fibres

---

* Colonial Office Colonial Research 1953–54 Reports of the Colonial Research Council , Colonial Products Council , Colonial Social Science Research Council , Colonial Medical Research Committee , Committee for Colonial Agricultural, Animal Health and Forestry Research , Colonial Insecticides Committee , Colonial Economic Research Committee , Tsetse Fly and Trypanosomiasis Research Committee , Colonial Fisheries Advisory Committee , Director—Anti-Locust Research Centre , and Research Matters not covered by the above Reports of the Specialist Advisory Bodies (Cmd 9303) Pp 278 (London H M Stationery Office, 1954) *7s 6d* net

Work on the chromatographic separation of the active principles of pyrethrum flowers has led to a method for the separation and spectrophotometric determination of the pyrethrin I and pyrethrin II fractions A comprehensive investigation of the assay of the proteolytic enzyme pepsin (the dried latex from the fruit of the paw-paw tree, *Carica papaya* L) was commenced Further work on Colonial sources of essential oils rich in safrole has indicated that distillation of the wood and bark together of 'medang kerangas' should give an oil containing more than 80 per cent of safrole Extensive work on eugenol and its derivatives has indicated that eugenol dibromide is of interest for the preparation of soluble vicinal dithiols for preventing poisoning by heavy metals, and that 1-(3′ 4′-dimethoxybenzyl)-5-propyl-7 8-dimethoxy*iso*quinoline hydrochloride has an interesting biphasic effect on blood pressure Work on groundnuts continued, but trade trials of sugar-cane wax in pastes, cream polishes and emulsions have been disappointing, and little progress has been made in finding a market for the wax Attempts are being made to determine the constituents of mangrove bark responsible for the objectionable dark colour of the extract. Work on carbohydrates included the isolation of a range of dextrans by growing bacteria and moulds on cane sugar, the isolation from cultures of *Betacoccus arabinosaceous* of the dextran-synthesizing enzyme dextransucrase in complex formation with dextran, study of the glucamylase of *Aspergillus niger*, the synthesis of fluorine derivatives of sugars and sugar alcohols and the production of cellulose from industrial wastes.

The performance of the experimental sugar factory at Trinidad in 1953 compared well with its performance in 1952, and modernization is now almost complete Considerable advance has been made in clarification studies, and a system has been devised for cleaning sugar factory evaporators when coated with the most intractable of scales Conditions have been established for converting molasses into lævulinic acid and isolating the product. A more extended study of the fermentation of cocoa beans is being undertaken, and methods have been developed for the determination of each polyphenolic component of fresh and cured cocoa beans Besides the microbiology of jute, the nature of the pectic substances of the plant has been explored

The tenth annual report of the Colonial Social Science Research Council records as the principal difficulty the recruitment of senior staff Of the five American social scientists appointed under the special scheme for training American social scientists at British universities, Mr E H Winter has joined the staff of the East African Institute of Social Research and Mr and Mrs A Harris are returning to work in association with that Institute under the project for the study of African leadership, for which the Carnegie Corporation of New York has given £30,000 A Social Research Unit of three research Fellows was set up in the University of Malaya, but no successor had been found to Prof. W. Hamilton Whyte as director of the West African Institute of Social and Economic Research A linguistic survey of the British Caribbean Colonies is being undertaken by the University College of the West Indies, while at the University of Hong Kong the research programme has been very much extended Studies under Prof E H. G Dobby at the University of Malaya have covered land-use and tenure in Langkivi, the conservation of resources in Selangor and the human ecology of the fishing villages near Kuching, Sarawak Among studies undertaken by Colonial administrative and specialist officers during the year, special reference is made to Dr W. L I Verrier's research into the demography of Fijians, the research by the Rhodes–Livingstone Museum into prehistoric archæology in Northern Rhodesia and the adjacent territories and into the material culture of Northern Rhodesian tribes, particularly the Hukwe Bushmen and the tribes of Southern Barotseland, and the anthropological research by the Sarawak Museum on the Kelabits of the far interior, on group contacts and conflicts, and on native legend with particular reference to migrations and geography.

Nine further sections of the Ethnographic Survey of Africa were published during the year, making a total of twenty-four volumes Of the "Handbook of African Languages", Part 3 of the General Survey, "Non-Bantu Languages of North-East Africa", was in the press, and a special study, "Bantu Languages of Western Equatorial Africa", by M Guthrie, was published during 1953 A number of other projects have been completed for publication, and lists of these items and of publications during the year by workers assisted from Colonial Development and Welfare Funds are appended to the Council's report, together with the annual reports for 1953–54 of the Directors of the East African Institute of Social Research, the West African Institute of Social and Economic Research, the Institute of Social and Economic Research, the University College of the West Indies, and the Rhodes–Livingstone Institute, and the report for 1953 of the Educational Research Institute for Fiji and Western Pacific Territories.

To the nineteen established research schemes under the scientific supervision of the Colonial Medical Research Committee at the beginning of the year, two major long-term schemes have been added a field study of schistosomiasis in the Gambia, and a three-year study of the effects of changing temperature on insect physiology and behaviour, with special reference to insect relations to climatic conditions in the tropics The Committee's ninth annual report records the filling of five further vacancies and the posting of three research students—one overseas and two in London In February 1954,, under a financial scheme made by the Committee, a five-day conference on virus diseases was convened in Kuala Lumpur, with Prof P A Buxton as chairman The conference included, besides British and American workers from the Institute there, investigators from South Africa, East Africa, the Sudan, Australia, the American Army and its Graduate and Research School at Washington, the Rockefeller Virus Research Unit at Poona, the Malayan Medical Service, the University of Malaya, the Armed Forces in Malaya and the Colonial Office The meeting was concerned primarily with assessing the potential hazard of yellow fever, but discussions ranged over the wider field of arthropod-borne virus diseases, and comprehensive recommendations were made for relevant investigations. The Committee has also convened a conference of experts available in the United Kingdom, under Brigadier J. S. K Boyd as chairman, to review the present scientific position of the sickle-cell trait and sickle-cell anæmia and to advise it on suitable lines of investigation The Helminthiasis Sub-committee, having considered, in connexion with schistosomiasis, the pressing need for clarifying the present confusion in the identification of African snails carrying schistosomes and for correcting the over-emphasis hitherto placed on conchological evidence only, has directed attention to the desirability of having men trained in malacology, and of instituting a centre at which continuity of malacological studies could be maintained To meet these needs, it recommended that a Government research fellowship should be made available at the British Museum (Natural History) for research on snails in relation to schistosomiasis and other fluke infections of man and his domestic stock and their control Ten members of the Committee and Sub-committees visited various units in the field, and facilities of the research units continued to be much used by research workers from the United Kingdom for the short-term study of specific problems

The East African Standing Advisory Committee for Medical Research has recommended the establishment of a special unit to carry out demographic studies and to compile the vital statistics so essential as a background for many problems in medical research. The East African Government has approved the proposal to set up a council for Medical Research in East Africa as a corporate body. The Helminthiasis Research Unit at Kumba, British Cameroons, concentrated its work on loiasis and its transmission by *Chrysops* on obtaining as complete a picture as possible of the life-cycle of the principal vector, *C silacea*, and a comprehensive knowledge of its habits, food requirements and movements, and on ascertaining the identity of the species of filarial worms found in the monkey population of the forest canopy and whether the filariæ in the monkeys are the same species as those occurring in man, and also whether they develop in the same species of *Chrysops* It has been established that the migrating filariæ of *L. loa* develop not only in *C silacea* and *C dimidiata* but also in *C langi* and *C zahrai*, and an almost continuous census has been maintained of the infection-rate in the human and fly populations both at Kumba, where monkeys are common, and at Sapele, where they are absent Lack of staff restricted the mapping of the incidence of bancroftiasis in Tanganyika and in part of Kenya, but it is estimated that in Tanganyika two million people harbour the parasite Random sampling of populations in Kenya indicates that onchocerciasis is extremely common in the high hills cupping the north-east portion of Lake Victoria

Under the filariasis research scheme commenced in Malaya in July 1953, the main work is to be done in heavily infected hamlets along the lower reaches of the Pahang River in East Pahang, with headquarters at Kuantan. A pilot mass-treatment campaign indicated that the main difficulties inherent in any attempt to control Malayan filariasis by treatment with 'Hetrazan' or Banocide' are erratic attendance at the drug-parade, the occurrence of febrile reactions in about one-fifth of the persons whose bloods contained no microfilariæ, and the development in many persons of symptoms of intolerance to doses of the drug which had been borne quite well by patients in hospital

Investigations on guinea-worm at University College, Ibadan, were aimed at providing specially designed wells in selected rural areas in the heavily infested zones as a practical prophylactic measure, and laboratory studies on the early stages of development of the guinea-worm in the mammalian host, using puppies as the experimental animals The East African Malaria Unit at Amani has been expanded, making possible a more rounded attack on malaria problems, and the total *Anopheles* population in a particular district has been estimated by a system of mass spray-catching in houses In studies on the existence of biological races in *A gambiae*, the maxillary index in wild-caught specimens and in females bred from two different strains of this species maintained as laboratory colonies was investigated Sprayings with residual insecticides on a sugar estate in Northern Tanganyika indicated that the average dosage of 1 5 gm per sq m of 'Gammexane' dispersible powder is required to maintain a low anopheline house population, but such a treatment had no apparent effect on the parasite-rate of the adult estate population In Nigeria the Ilaro Experimental Control Scheme was concluded and an assessment of long-term suppression of malaria in three hundred African school children is in its second year Studies of the newer anti-malarial drugs continued at the Institute for Medical Research, Kuala Lumpur, and the effect of residual insecticides on Malayan mosquitoes was also examined

At the West African Virus Research Institute, Lagos, an *in vitro* test for detecting yellow fever antibodies is being developed, and the East African Virus Research Institute, Entebbe, investigated an epidemic of dengue-like fever in Newala District, Southern Tanganyika, and has shown that *A aegypti* was the main vector Work continued on virus–tissue relationships, on the virus of Rift Valley fever, and on the hatching impulse in eggs of mosquitoes of the genus *Aedes* Epidemiological investigations at the Trinidad Regional Virus Laboratory indicate the presence in certain areas of Trinidad of a virus agent closely related to, or identical with, Ilheus virus, which is immunizing a considerable proportion of the population

In a summary of observations made by the United States Army Medical Research Unit in Malaya, reference is made to a long-term study of the incidence and manifestations of arthropod-borne viral infections of humans in Malaya and their ecology, to an exploratory survey which indicates that leptospirosis is very prevalent in man, domestic animals and wild rodents in Malaya and emphasizes the importance of the primary jungle as an endemic focus, and to field studies in North Borneo which indicate that 'Dieldrin' and 'Aldrin' provide an effective and practical means for controlling the mite vectors of scrub-typhus through the disinfestation of terrain

Investigations on relapsing fever in East Africa are now being concentrated on the south-western regions, where the disease is much more prevalent At the Lister Institute of Preventive Medicine, London, the inhibition test for the identification of blood-meals of closely related species has been established as a routine measure Work on acclimatization in insects at the London School of Hygiene and Tropical Medicine has confirmed that the chill coma temperature and the ability to survive cold can be substantially modified by keeping several insects for twenty-four hours or less in warmer or cooler conditions within their normal zone of activity, and has also shown that tolerance to temperatures at the upper limits can be altered. Academic studies at the Hot Climate Physiological Research Unit, Nigeria were mainly concerned with nutrition; but the Unit has also made observations of working conditions in the Enugu Colliery and physiological observations on a training march of the Fourth Battalion of the Nigeria Regiment which are of value to civilian as well as to Service authorities. Evidence has been obtained which suggests that the sickle-cell trait affords much protection against subtertian malaria; in Nigeria, where 'Dapsone', as elsewhere, is now the routine treatment for leprosy, a three-year study of thiosemicarbazone has given evidence that resistance to the drug develops. Investigations of goitre in Sierra Leone suggest that the chief factor in the distribution of endemic goitre there is the difference in iodine content of the rocks from which the drinking waters and local foodstuffs are obtained.

The East African Medical Survey completed its first phase of five years in December 1953, and its investigations, which have comprised field-surveys to establish pictures of disease in East Africa, laboratory research on methods of control of disease, and pilot schemes to assess the efficiency of these methods, are summarized in the report. There is also a brief summary of work undertaken in the Federation of Malaya on nutrition, of work in Jamaica on vomiting sickness and the psittacosis–lymphagranuloma venereum group, and in Kenya on kala-azar, on the primary reservoir of plague, and the eradication of *Simulium neavei* from onchocerciasis foci by treating the rivers with DDT emulsion.

Grants totalling £235,043 for new and supplementary schemes were made during the year from Colonial Development and Welfare Funds by the Committee for Colonial Agricultural, Animal Health and Forestry Research, the annual report of which again acknowledges particularly the assistance of the Commonwealth Institutes of Entomology and of Biological Control and the Commonwealth Mycological Institute. In East Africa, where all sections of the Agriculture and Forestry Research Organization report progress, glasshouse studies have shown that resistance to *Puccinia polysora* may exist in certain Central American maizes, whereas none has been found in any African type; and that resistance appears to be controlled by a dominant major gene. Evidence has been obtained that in the Aberdare Mountains cypress plantations intercept less water than the natural bamboo cover, and are therefore preferable in conserving underground water supplies. At the East African Veterinary Research Organization, rinderpest research has led to the development of a conglutination test for rinderpest, and field-surveys have shown no evidence that immunity to East Coast fever is produced by recurring clinical disease, although it is probably constantly reinforced by infected ticks. Valuable information has been obtained on the timing of anthelmintic treatment by studies on the development of *Haemonchus* larvæ under field conditions. The joint Animal Industry Division, shared by the two research organizations, has made a promising start, while the four West African Governments have agreed to establish a Permanent Standing Advisory Committee for Agricultural Research.

The West African Cacao Research Institute has opened a sub-station at Moor Plantation, Ibadan, for the study of the somewhat different problems encountered in Nigeria from those of the Gold Coast. Cacao virus studies have revealed five new hosts of swollen shoot virus, and special studies are being made on *Cola* spp. in collaboration with Kew Herbarium, and a chemical method has been developed for the diagnosis of swollen shoot virus in leaves of symptomless trees. The fitting-up of the laboratories of the West African Rice Research Station, Rokupr, Sierra Leone, was completed, and besides research on rice selection and breeding, trials were commenced on the use of hormone arboricides for the destruction of mangroves on land.

At the West African Institute for Oil Palm Research, work was concentrated on agronomy, plant breeding and plant pathology, and is supported by a strong Statistics Division. The breeding programme of the West African Maize Rust Research Unit is now sufficiently advanced for some rust-resistant selections to be grown in multiplication plots for distribution to farmers, and increasing attention is being given to breeding varieties resistant to other diseases and pests, particularly stem borers. Hybridization of the Gros Michel banana with synthetic parents continued at the Banana Breeding Station in Jamaica, the Anglo-Columbian expedition in search of new material for cacao proceeded into 1953, and work continued on shade and nutrient relations, hormone sprays and nutrient injections, iron chlorosis, stock-scion relationships and systems of training young cacao. A detailed ecological survey of cacao estates in Trinidad was commenced.

Among the research undertaken by Colonial Departments and which is recorded in this report may be mentioned the chromatographic investigation, in British Guiana, of the amino-acid distribution in sugar-canes for different 'leaf-scald' reaction; the success obtained in the Gold Coast in control of the common borers attacking maize, *Sesamia* spp. and *Busseola fusca*, by dusting the young plants with DDT fourteen and sixteen days after germination, and the good results obtained by the pasture research section in Kenya in widespread trials with a strain of *Setaria sphacelata* ex Nandi. Promising results in yield, strength of straw, and earliness have been obtained in widespread trials of local varieties of rice in Malaya. In tea research, copper sprays continued to give the best control of blister blight (*Exobasidium vexans*), though copper dusts have also recently given good control. Trials in the destruction of forest weeds in Malaya continued, and in further tests against ambrosia beetles creosote gave good protection to barked logs when applied by brush. The Veterinary Research Institute was opened on June 10, 1953, and its work has so far been directed mainly to the production of vaccines for immediate field-use and to the diagnosis and confirmation of live-stock disease from specimens submitted by field-officers. In Nigeria a new study of the effect of green manure on land depleted of organic matter was started, while the Forest Research Branch, Ibadan, continued to investigate the regeneration of the high forest, particularly with the view of decreasing costs of regeneration. At Zanzibar the premature nut-fall and gummosis of coconuts caused by the Coreid bug *Theraptus* and other insects were further investigated, and preliminary spraying trials indicated that 'Dieldrex' is the most effective insecticide for the control of the more serious *Anophelepsis custodiens*.

The seventh annual report of the Colonial Insecticides, Fungicides and Herbicides Committee includes, as usual, an account of the work of the Colonial Insecticide Research Unit at Porton, where in studies on the behaviour of urea-formaldehyde resins containing insecticides it was found that non-blooming films containing low concentrations of 'Dieldrin' possessed a high residual toxicity to some insects. Particularly promising results were obtained in laboratory tests of granular insecticides as larvicides, and the engineer attached to the team succeeded in fitting a rotary brush-spray unit to an Anson XIX aircraft and testing its operation, as well as fitting a hopper for pelleted material to a D H Beaver aeroplane At the Imperial College Field Station work continued on the penetration of the insect integument by DDT solution, the contamination of flies by particulate deposits and the olfactory stimulation of tsetse flies At Long Ashton Research Station trials continued on the adhesion of copper fungicidal spray deposits to foliage with and without stickers, while the work at Rothamsted was again concerned with the loss in toxicity of DDT deposits on foliage and on glass plates under simulated tropical conditions, and the prevention of such loss. The Research Unit at Arusha continued to work on the same lines as last year, and a reduction of tsetse fly of more than 99 96 per cent was achieved by large-scale aerial spraying with DDT at Maruzi, Uganda. Other work was concerned with the defoliation of bush and control of weeds, of mosquitoes and of grain-eating birds. Good progress was made in establishing the research unit at Ilonga, Tanganyika The investigation of the ecology and habits of *Anopheles gambiae* in Mauritius, filariasis research in Malaya and research on defoliants in East Africa continued the latter investigations indicate that aircraft application of *n*-butyl 2 4 5-trichlorophenoxyacetate will defoliate a wide range of species of trees

Other work noted in the report is that in Malaya on the trials with 'Dieldrin' against *Anopheles maculatus*, *A. sundaicus* and *Culex fatigans*, and on the destruction of forest weeds, that with 'Dieldrin' in Tanganyika for control of white coffee borer, *Anthores leuconotus*, and that of the Mosquito Control Service in British Guiana on the bionomics and control of *Culex fatigans* and the comparative toxicity to its larvæ of DDT, BHC, 'Chlordane', 'Dieldrin', 'Aldrin' and other insecticides

The Colonial Economic Research Committee still finds difficulty in attracting native scholars to work in the Colonial Territories, but has been able to secure excellent candidates for its new projects. Dr F. C. Wright completed his study of the structure and organization of the distribution industry in Tanganyika and Nyasaland Dr Ida Greaves was preparing a report on the methodology of capital formation studies with special reference to Jamaica, Mr D T Edwards was making a detailed study of the economics of small farms in Jamaica, and Mr A D Knox was completing a study of the development of trade between British West Indian territories, past and present Mr F H H King was studying the monetary systems of the Far East At the beginning of the academic year 1952–53, a research division was established, with Colonial Development and Welfare and Gold Coast Government funds, within the Department of Economics of the University College of the Gold Coast

The report for 1953–54 of the Tsetse Fly and Trypanosomiasis Committee reports good progress in the construction of the Central Trypanosomiasis Research Laboratory at Sukulu for the East African Tsetse Fly and Trypanosomiasis Research and Reclamation Organization, but the shortage of qualified officers continued until late in 1953 Studies of *G. morsitans* continued throughout the year, and research on *G pallidipes* has been undertaken in the Lambwe Valley (Kenya) and in the Busoga district of Uganda Field-trials of the role of biting flies have shown that 37 5 per cent of a small herd of cattle contracted *T. congolense* infections over a period of ten months in 1953, and 17 0 per cent of another herd after exposure for six weeks In field-experiments, regular administration of 'Antrycide' at two-monthly intervals for a limited period daily protected cattle against *G austeni* even after the cessation of treatment Experimental reclamation and pilot schemes in the three East African territories proceeded according to the general plans The West African Institute for Trypanosomiasis Research reports that *T vivax* is not only the species of trypanosome most commonly found in zebu cattle in Northern Nigeria, and probably elsewhere in West Africa, but also that in some localities this species is capable of causing a high proportion of deaths of the host Factors governing its transmission by *G palpalis* have been further studied, and studies on the tolerance of Ndama cattle to trypanosomiasis continued Further experience indicates that 'Antrycide' methyl sulphate gives uniformly satisfactory results in treatment of zebu cattle infected with trypanosomiasis in West Africa, and recent experiments have shown that 'Antrycide'-resistant strains of *T. congolense* became progressively less resistant after serial passage

Work on the use of 'Melarsen' in the treatment of human trypanosomiasis continued in collaboration with the Nigerian Sleeping Sickness Service, and prophylactic 'Pentamidine' has proved an efficient, safe and rapid means of reducing the incidence of sleeping sickness in a population of 2,500 in a selected area in Northern Nigeria

The annual report on fisheries research for 1953–54 of the Colonial Fisheries Advisory Committee reports vacancies for five scientific officers at existing research stations and an uncommitted balance on March 31, 1954, of £116,000, against which provision for new schemes and the extension of existing schemes to March 31, 1956, is estimated to total £80,700. The Inter-territorial Fisheries Research Station at Jinja, Lake Victoria, collected a comprehensive series of hydrological data, giving a better understanding of the complicated water movements in this Lake, and these movements have been related to the variable growth of plankton in certain areas Observations on the rate of growth of *Tilapia* indicate that the quality of the food may be more important than the amount eaten A thorough investigation has been made of the physical and chemical conditions obtaining in papyrus and water-lily swamps At Zanzibar a comprehensive report has been written on the pelagic fishes, the taxonomy and distribution, the gear used in trolling and the various types of lures employed, but the joint Northern Rhodesia-Nyasaland Freshwater Research Station, which has now moved to Nkata Bay, Lake Nyasa, for a two-year investigation of the Lake, was able to carry out very little research on Lake Bangweulu owing to building delays The West African Fisheries Research Institute's studies of the movements, growth breeding and feeding habits of twenty-seven species of endemic marine and brackish water fishes have shown that catches of *Drepane* species are affected by the phases of the moon.

The Fisheries Research Unit at the University of Hong Kong is now well established

The report of the Director of the Anti-Locust Research Centre on locust research and control during 1953–54 emphasizes the need for additional accommodation The present quarters are inadequate for the personnel, and while requests from abroad for the accommodation of research workers and students have to be refused, the recording and summarizing of current information on the developing plague of the desert locust continues to delay the progress of the research work essential for long-range planning of international anti-locust measures During the year, 1,363 reports on the locust situation were received from thirty-eight countries and territories and the desert locust situation continued to deteriorate The plague has extended almost to the maximum area liable to invasion, the intensity of infestation is likely to increase and exceptional efforts were required from the Desert Locust Control to reduce the dangers of devastation of East Africa, which was seriously invaded Inadequate support by countries to the Food and Agriculture Organization's initiative for locust control in the Arabian peninsula led to large escapes from Arabia and elsewhere, which were responsible for the alarming increase in the infestations over the whole of the northern half of Africa and south-western Asia as far as India Nevertheless, the research activities of the Desert Locust Survey are continually expanding and bearing fruit, and the International Council for the Control of the African Migratory Locust has also created a permanent research service

Some miscellaneous matters not covered by the reports of the specialist advisory bodies are this year relegated from the report of the Colonial Research Council to a special section at the end of the report These include the research of the African Studies Branch of the Colonial Office into problems of African administration such as land tenure and land policy, that under the Colonial Liaison Organization of the Building Research Station into the durability of paint, solar water-heating and climatological studies, and that of the East African Industrial Research Board and of the Colonial Road Research Advisory Committee, which refers particularly to problems of road construction in Malaya, Singapore, Sarawak, Brunei and North Borneo Recruitment of field-staff for geodetic and topographic surveys kept just ahead of transfers and resignations, very satisfactory progress was made with geodetic surveys, the survey of control for mapping required for the Volta River project was completed and the output of mapping increased owing largely to fewer changes of priority

The overseas scientific staff of the Colonial Geological Surveys increased from 190 to 197 during 1953, but twenty posts were still vacant Satisfactory progress continued in all branches, including geological mapping, the investigation of mineral resources and the geological aspects of engineering and water-supply projects The shortage of qualified meteorologists continued to restrict research work, but the East African Meteorological Department is studying problems connected with the artificial control of rainfall In Mauritius, research on the correlation between rainfall deficits and excesses at the various seasons and the tonnage and sucrose content of the sugar-cane crop is expected to provide a more accurate guide to the tonnage of cane to be crushed and the probable total sugar production each year

At the National Institute of Oceanography, the study of oceanic water movements is intended to have first place in the programme of research in marine physics, but progress is slow. Researches in marine physics are being linked as closely as possible with the biological work.

MECHANISM OF INTESTINAL ABSORPTION OF FAT

By Prof A. C. FRAZER

Department of Pharmacology, University of Birmingham

FIRM progress in biological research is dependent on the proper use of hypothesis From time to time a generally accepted view in some field of study may be shown to be wrongly based, and in this case a new hypothesis is needed to replace the old But, n the change over from old to new, misunderstanding and confusion may arise Such has been the case in he field of fat absorption A statement of the main facts may help to correct this situation

The story begins with the lipolytic hypothesis of Pfluger[1], which was put forward at the turn of the entury and generally accepted as the basis for the at absorption mechanism The essential features f this hypothesis were the necessity for complete hydrolysis of glycerides, absorption of lipids from the ntestinal lumen in water-soluble form only, re-ormation of glycerides in the intestinal cell and assage of particulate glycerides in the chyle, giving ise to the alimentary hyperlipæmia in the systemic lood. In 1936, Verzár and his colleagues[2] introduced ome new facts which entailed the modification of he details of Pfluger's hypothesis. Thus, the bringing of the fatty acids into solution in water was considered to be largely due to the hydrotropic action of bile salts rather than soap formation, as originally proposed They also put forward the view that the re-synthesis of triglycerides in the intestinal cell had to pass through an intermediary phospholipid stage, which was controlled by the adrenal cortex These modifications, however, did not affect the essential basis of Pfluger's hypothesis Bloor[3] supported this view of the fat absorption mechanism

Some doubts on the question of the completeness of lipolysis, especially in the cat, were expressed by Mellanby[4] Stimulated by these observations, my colleagues and I carried out a series of experimental studies from 1934 onwards on various aspects of fat absorption Our studies were especially concerned with particulate fat in the blood, the different effects and characteristics of absorption of various fatty acids and glycerides, lipolysis both *in vitro* and *in vivo* and defective fat absorption in human subjects[5–9] This work led us to the conclusion that lipolysis need not be complete before the absorption of glycerides occurred Since no hydrotropic mechanism for glycerides could be demonstrated in the intestinal lumen, this conclusion was incompatible with two of the principal tenets of the lipolytic hypothesis The methods we used were, of necessity, indirect, so that final settlement of this matter had to await studies involving the use of isotope-labelled molecules These studies were eventually carried out by Favarger and his colleagues[10,11], Karnovsky and Gidez[12] and Reiser and his co-workers[13], all of whom substantiated our view that complete lipolysis was not an obligatory step in fat absorption Our observations on the formation of monoglycerides and diglycerides during pancreatic lipolysis were also confirmed and considerably extended by Desnuelle and his group[14,15] and by Mattson *et al* [16] It is now generally accepted by workers in this field that lipolysis in the intestinal lumen is partial and not complete[17] This was the first step towards the modern concept of the fat absorption mechanism

In 1943 it was thought that all lipids were absorbed from the intestinal lumen, molecularly dispersed in water-soluble form Our studies indicated that this was not necessarily the case, and that water-insoluble glycerides were also removed from the lumen of the intestine For many years the fact that paraffins were not normally absorbed from the intestine had been regarded as strong supporting evidence for the lipolytic hypothesis, since these molecules could neither be hydrolysed by lipase nor brought into solution in water Some absorption of paraffin had been reported, however, by earlier workers[18–21] The quantities involved were said to be small, however, and there was no clear link with the fat absorption mechanism in these studies In 1944 we demonstrated the absorption of paraffin administered intraduodenally to rats in finely particulate form[22] Shoshkes, Geyer and Stare[23] obtained substantially similar results In 1951 we reported a new series of experiments[24], which showed that paraffin could be removed from the intestinal lumen in considerable quantity, provided that it was fed in a suitable glyceride vehicle The importance of glyceride appeared to be related to its ability to cause fine emulsification of the glyceride/paraffin mixture The absorption of paraffin in a glyceride vehicle has been confirmed by Bernhard and Scheitlin[25] These and a number of other investigations indicate that fine emulsification in the intestine is an important step in the removal of the water-insoluble fraction from the lumen, quite apart from any facilitating effect the fine dispersion of the oil may have on the rate of lipolysis[17]

From the outset, the work in my laboratories has been dominated by the fact that lipid molecules must be distributed between the oil and water phase in accordance with their partition coefficients On studying the question of removal of lipid molecules from the oil into the water phase—a stage of the fat absorption mechanism that had been strangely neglected—it was soon apparent that there were considerable differences between short-chain and long-chain saturated fatty acids These differences in partition were also reflected in differences in absorption of the corresponding glycerides—the more water-soluble fatty acids disappearing from the chyle, while the more fat-soluble molecules were retained. Some of these differences had been previously reported by other investigators[26–28]. In 1946, discussing the absorption of free fatty acid independently of the glyceride oil phase, I reached the conclusion " . that fat can be absorbed as fatty acid, provided that the cleavage products can be removed into the aqueous phase from the oil/water interface. This appears to be more easily accomplished in the case of butyric acid than the long-chain fatty acids . . It is concluded, therefore, that fat may pass by the portal vein and that this pathway is used when fatty acid is absorbed During th glyceride absorption, it is the short-chain fatty acids which are most likely to be concerned in this mechanism"[29] Five years later the differential distribution of short-chain and long-chain fatty acids between the chyle and portal blood was confirmed by Chaikoff and his group[30,31] These workers were the first to provide direct proof by the use of isotope labelled materials of the passage of fatty acids in the portal blood.

The importance of partition between the oil and water phase as a factor in the differential absorption of fatty acids and glycerides does not appear to have been fully appreciated. Thus, Bloom, Chaikoff Reinhardt, Entenman and Dauben[32] and Bergstrom Borgstrom, Carlsten and Rottenberg[33] appeared to expect long-chain saturated fatty acid (stearic acid and a glyceride oil phase to be absorbed by different pathways It would be anticipated, however, from consideration of the partition hypothesis[6,29] tha there would be no such differentiation and that the lipid-soluble fatty acid would pass in the chyle. This was found to be the case

Oleic acid was used by us in our earlier experiments because it is liquid at body temperature Under the conditions of our experiments, differences were demonstrable during the absorption of olei acid as compared with olive oil Since at that time olive oil was said to be absorbed only in the form o oleic acid and glycerol, this was an additional poin against complete lipolysis It seemed likely tha oleic acid might be found to be intermediate between the saturated long-chain and short-chain fatty acids in its behaviour during absorption. Since our primary objective was achieved and free fatty acids were no normal dietary constituents, we did not pursue the question of oleic acid absorption further However other workers—notably Tidwell[34], Singer, Sporn and Necheles[35], and recently Bergstrom, Blomstrand and Borgstrom[36], using radioactive isotope-labelled olei acid—have done so These investigators found tha under the conditions of their experiments oleic acid behaved similarly to the long-chain saturated fatty acids and was mainly recovered from particulate fa in the chyle They also confirmed the classica observations of Munk and Rosenstein[37] that fatty acids can be esterified in the course of absorption Only in one group of these experiments has the stat of the fatty acid in the intestinal lumen been reported[38], and in this case it was finely emulsified so that oleic acid itself may provide the particulat oil phase In our experiments there was no demonstrable fine emulsification of the oleic acid in th intestinal lumen and no visible emulsified fat in th chyle during the course of the experiment, so tha we could only observe non-particulate absorption The detailed study of the factors affecting oleic acid absorption might prove to be of interest in connexion with abnormal fat absorption The evidence so far available is not incompatible with the partition hypothesis

Thus, the conceptual changes involved in th replacement of the lipolytic hypothesis of Pfluger by the partition hypothesis are as follows

(1) Complete hydrolysis of glycerides to fatty acids nd glycerol is not an obligatory step in the process f fat absorption.

(2) Lipids do not have to be brought into wateroluble form before they can be removed from the mall intestinal lumen

(3) Eventual partition of the lipid molecules etween the oil and the water phase may affect their istribution in the body after absorption.

These three basic tenets have been strongly suported by studies involving the use of isotope-labelled aterials and other techniques that were not available hen the hypothesis was originally formulated The ther available facts about fat absorption—such as he effect of bile salts, the mechanism and significance f intraluminar emulsification, phospholipid formaion, the metabolic activity in the intestinal cells and he differential absorption of lipid-soluble molecules —can be fitted into the general framework of this artition hypothesis.

OBITUARIES

Dr. R. C. Wallace

SCOTLAND has given many of her sons to Canada, but few, if any, have contributed as much to Canadian life as Robert Charles Wallace, who died at his home in Kingston, Ontario, on January 28, at the age of seventy-three Recognized for many years as the doyen of Canadian vice-chancellors, he took an active part in the educational, cultural and scientific life of the Dominion. A native of the Orkneys, at the age of twenty-nine, after a university training which included undergraduate and graduate study at Edinburgh, where during 1909–10 he held an 1851 Exhibition Scholarship and was a Carnegie Fellow, a year as a demonstrator at St Andrews, and a period in Gottingen, where he obtained his Ph D , he went to Canada in 1910. He joined the staff of the University of Manitoba as a lecturer in geology, and after two years was made head of the Department of Geology and Mineralogy. During his Manitoba period he was Commissioner of Northern Manitoba during 1918–21 and Commissioner of Mines and Natural Resources for Manitoba during 1926–28. By 1928 the marked gifts he had shown as scientist, writer, speaker, administrator and educational leader led to his appointment in that year as second president of the University of Alberta This post he held until 1936, when he was appointed principal and vice-chancellor of Queen's University, Kingston, Ontario. In this position he remained until his retirement in 1951

While at Alberta and at Queen's, he combined his duties as vice-chancellor with many activities. At various times he was chairman of the Research Council of Alberta , a member of the National Research Council of Canada , chairman of the Ontario Research Commission , president of the Royal Society of Canada, of the Canadian Institute of Mining and Metallurgy, and of the Association of Canadian Clubs He was a Fellow of the Geological Society of America, of the Mineralogy Society of America, and of the Society of Economic Geology. Towards the end of the Second World War he took an active part in the proceedings of a Federal Government Committee which led to the publication of the Wallace report on the conservation and development of Canada's natural resources He played an important part in the founding of Unesco, being one of the original three Canadian delegates. In New York his counsel was sought and welcomed by the Carnegie Corporation

With such a record it is not surprising that he was given honorary degrees by as many as twenty universities, among them his *Alma Mater* Edinburgh, Oxford, the Queen's University, Belfast, and Harvard

After retirement, Wallace continued to be active until within a few months of his death Among other things, he was an executive director of the Arctic Institute of North America, adviser to the Ontario Government on university grants, a member of the Defence Research Board of Canada, and Canadian advisory editor of the "Encyclopaedia Americana"

At Queen's, under his guidance, apart from a big increase in physical assets, such as new buildings, and the founding of such new teaching 'schools' as nursing, industrial relations and local government, there was a marked increase in research in science and in medicine, and in the humanities high scholarship was stimulated In making new appointments, although he insisted on high professional qualifications, he sought also men of character and culture, believing, to quote his own words, that "no teachers can conceal their characters and outlook on life from a class".

Unbending as granite where ethical principles were concerned, Wallace listened gladly to views opposed to his own and was kind to people in all walks of life His office door was open, literally and metaphorically, to members of staff and students alike. Like most Scots, he made no outward display of the sentiment which lay below the surface. But only a few months before his death, on the occasion of the centenary of *The Orcadian,* he wrote with feeling of "scenes of cliff and sea and sky" and of "that indescribably soft ethereal light at or near midnight on summer's longest days in the Orkneys", things which were caught "indelibly in memory".

He is survived by his wife, Elizabeth Smith, also a native of the Orkneys, whose graciousness and natural charm added greatly to the warm welcome given the many who went to the principal's residence on Queen's University grounds. Three daughters, Mrs D E Woodsworth, Mrs H. W. Addington and Mrs Charles Baugh, also survive A son, Ronald, died in 1936 J K ROBERTSON

Mr G W Grabham, O.B.E.

GEORGE WALTER GRABHAM was born in 1882 in Madeira, where his father, Dr Michael Grabham, was a well-known resident. Educated at University College School and at St John's College, Cambridge, he joined the Geological Survey of Great Britain in 1903 and worked in Scotland until 1906 He then followed T. Barron as Government geologist in the Anglo-Egyptian Sudan. There, throughout his service, he travelled widely, on foot and by river, with camels and with both early and modern motor transport He was mainly concerned with the most vital need—water, and in his journeys and special investigations he gathered a unique knowledge of the geology of the country. By far the greater part of his work is represented by unpublished reports in the Geological Survey office in Khartoum. He was also closely interested in the people's agricultural and other pursuits, past and present, and was acting conservator of antiquities.

Outside the Sudan he made extensive journeys, about which little was heard, in inter-tropical Africa, he was best known for his official mission to Lake Tana (with R P. Black, 1920–21)

Grabham retired from the Geological Survey of the Sudan in 1934, but was retained as geological adviser until 1939. After the Second World War he wintered in the Sudan, maintaining vigorously his many and varied personal interests

In Madeira he inherited his father's house, where his affection for the island, and all that it implied for him, was widely known To the end he made exacting walks in that land of profound cliffs and gorges Here, as in the Sudan, he took unflagging pleasure in showing others the country, either on the ground or with the aid of his vast collection of photographs and lantern slides, his hospitality was proverbial

He was a familiar figure at international geological congresses, and on their long field excursions, in many parts of the world, and for many years hi annual visit to Britain coincided with the meeting o the British Association, at which he enjoyed meetin his friends, latterly he came to his clubs in Londo twice a year, and made a tour of his diminishin circle of relatives and close associates

To many, Grabham seemed a lonely man, but h delighted in company, a rather forbidding figure but he had an inexhaustible fund of humour, of hi sympathy and kindness the sum will never be tol His end was as he would probably have wished, h was about to lecture to a cultural meeting in Kha toum, but, feeling unwell, took his leave and bicycle home to his house in Burri Village, where he wa found dead the following morning. So passes great figure. K S. SANDFORD

Dr W. M Ware

FORMER colleagues have experienced a deep sens of loss following the sudden death, on February 1 of William Melville Ware at the age of sixty-tw Particularly has the loss been felt by many prese and past members of Wye College (University London), for it was there that all his scientific wor was done.

Ware entered Wye College in 1911 as a studen after receiving a grounding in the classics at Dov College, followed by a period in an academy at I Havre, where he attained fluency in French. Durin the First World War he was on active service wit the Army and on demobilization returned to Wye as lecturer in botany. Research, however, was his *métie* while still a lecturer he investigated problems clover with a grant from the Ministry of Agricultur and this led to the publication of several papers on th subject and on certain diseases of other plants

In 1923 he accepted an invitation to join th Mycology Department (Research and Advisor under the direction of Prof. E. S Salmon. For th next twenty-three years his investigations formed major stimulus to the growth of the young science plant pathology

His main researches were on diseases of fruit, ho and mushrooms, but other horticultural and agr cultural crops also received attention, and about hundred original papers of high quality appear under his name, either alone or jointly with colleague His researches into apple scab (*Venturia inaequal* (Cooke) Wint) and hop downy mildew (*Pseud peronospora humuli* (Miyabe and Tak) G. W. Wilso are particularly outstanding, while his observatio on the cultivated mushroom led not only to t discovery of crop-reducing diseases, but also to t writing of a bulletin on mushroom-growing for t Ministry of Agriculture. Following his first degree B Sc. (Agric), he was awarded the M Sc in 1923 a the D.Sc in 1935.

Ware followed Prof Salmon as head of t Mycology Department at Wye in 1937, and direct research and advisory work through the difficult w years, but the decision to absorb the Departme into the Civil Service prompted his retirement October 1946.

Ware served on the Council of the Association Applied Biologists and as a member of the Pla Pathology Committee of the British Mycologic Society; but his distaste for committee wo debarred him from seeking office in the learn societies His contributions to science are familiar plant pathologists throughout the world and, had his ambition equalled his ability, high academic rewards would undoubtedly have been his.

In retirement, gardening and travel were among his chief delights, but since 1948, as assistant editor of the *Journal of Horticultural Science*, he had kept in touch with current research.

Although modest and reserved to an unusual degree, Ware's attractive personality brought him a wide circle of friends, and many of those who knew him best have reason to be grateful for his help and for his counsel, which was sought by his seniors as well as by his juniors. He leaves a widow.

H. H. GLASSCOCK

NEWS and VIEWS

Research in the Physics of Solids

Prof. A. H. Cottrell

PROF. A. H. COTTRELL, of the Department of Physical Metallurgy, University of Birmingham, has accepted an appointment with the U.K. Atomic Energy Authority, at the Atomic Energy Research Establishment, Harwell, as deputy head of the Metallurgy Division and leader of a group engaged in research on the physics of solids. He will be taking up his new appointment in April. Prof. Cottrell, who is thirty-five, is a graduate of the University of Birmingham. During 1939–45 he was engaged in research on the welding of tank armour. He was appointed a lecturer in metallurgy in the University of Birmingham in 1943. When the late Prof. Hanson, immediately after the War, was re-organizing teaching and research in metallurgy at Birmingham, one of his principal objects was to create a strong school of theoretical and physical metallurgy. The Department of Scientific and Industrial Research gave substantial support for an initial period, and with notable vision Prof. Hanson recommended the University to create two new professorships, one in physical metallurgy and the other in metal physics. Accordingly, in 1949 Dr. Cottrell and Dr. G. V. Raynor, then reader in theoretical metallurgy, were appointed to the new chairs. On the death of Prof. Hanson in 1953, Profs. Cottrell and Raynor were made joint heads of the Department of Physical Metallurgy.

Prof. Cottrell's researches have been mainly concerned with the plastic deformation of metal crystals. In ample justification of Prof. Hanson's hopes, he and the group of able young men whom he has gathered around him have done much to establish Britain's leading position in this field of research. Prof. Cottrell has travelled extensively—he made lecture tours in the United States in 1950 and 1953 and was guest lecturer at the University of the Witwatersrand in 1952 and at the University of Louvain in 1953. He attended the Ninth International Solvay Conference on Physics at Brussels in 1951, and delivered the 1953 R. S. Williams Lectures at the Massachusetts Institute of Technology. He was awarded the Rosenhain Medal by the Institute of Metals in 1954. Prof. Cottrell has acted as chairman of the Basic Properties Committee of the Inter-Service Metallurgical Research Council, and is also associate editor for Great Britain of *Acta Metallurgica*.

Psychology at Glasgow : Prof. R. W. Pickford

PROF. RALPH WILLIAM PICKFORD, who has been appointed to be the first incumbent of the recently created chair of psychology in the University of Glasgow, has been associated with the Department of Psychology at Glasgow for more than twenty-five years. His first appointment there was in 1930 as assistant to Dr. R. H. Thouless, becoming lecturer in 1935 and senior lecturer and head of the Department in 1948. Dr. Pickford was a student at the then Southampton University College before proceeding in 1923 to Emmanuel College, Cambridge, where he graduated in psychology and obtained his Ph.D. in 1932. During 1927–32, with a grant from the Vision Committee of the Medical Research Council, Prof. Pickford undertook research on the psychology of reading. His publications include a monograph, two books, and many papers and articles dealing especially with experimental studies of colour vision and visual perception, and with the psychology of art and social and clinical psychology. He has been president and is retiring secretary of the Scottish Branch of the British Psychological Society, and was a founder member and the first president of the Experimental Psychology Group. For ten years he has worked in a voluntary capacity at the Notre Dame Child Guidance Clinic, at the Davidson Clinic, Glasgow, and as a counsellor for the Glasgow Marriage Guidance Council. He is keenly interested in music.

Sir George Beilby Memorial Awards, 1954

THE administrators of the Sir George Beilby Memorial Fund, representing the Institute of Metals, the Royal Institute of Chemistry and the Society of Chemical Industry, have made awards from the Fund for 1954, each of one hundred and fifty guineas, to Dr. H. K. Hardy and to Dr. J. W. Menter. The awards are made to British investigators for work in such fields as fuel economy, chemical engineering and metallurgy, in which Sir George Beilby's special interests lay, and in general they are given to relatively young scientists for work over a period of years.

Dr. H. K. Hardy's award is for work in physical metallurgy, with special reference to precipitation hardening and to the thermodynamics of phase equilibria in alloy systems. He graduated in metallurgy from the Imperial College of Science and Technology, London, in 1940, and afterwards, while at the Research Department of the Northern Aluminium Co., Ltd., and at Aluminium Laboratories, Ltd., he was concerned with the metallography of duralumin-type alloys and the development of high-strength aluminium–zinc–magnesium alloys, particularly the nature of the extrusion process and the microstructural effects associated with the onset of overheating. In 1946 he joined the Fulmer Research Institute as head of the Physical Metallurgy Section and later as senior metallurgist, where he investigated the precipitation process in aluminium–copper alloys over a wide range of supersaturations and with the addition of small quantities of other elements. The thermodynamics of this and other phase equilibria in alloy systems have been closely studied.

Dr. J. W. Menter entered Peterhouse, Cambridge, and after governmental war-time service graduated in physics in 1945. His Beilby award is for work on surface phenomena, with special reference to the application of electron optical techniques to the elucidation of a wide range of problems , and this work commenced at Cambridge in the Research Laboratory for the Physics and Chemistry of Surfaces. Department of Physical Chemistry, with a study by electron diffraction of the orientation of long-chain hydrocarbon compounds on metal surfaces. He has applied electron optical techniques to metallurgical problems, and more recently he has adapted a transmission electron microscope for use as a reflexion instrument and investigated a wide range of surface phenomena. Dr. Menter is at present working in the Tube Investments Research Laboratories, Hinxton Hall

Royal Society of Edinburgh . New Fellows

The following have been elected Fellows of the Royal Society of Edinburgh Mr W. Anderson, district geologist, Geological Survey of Great Britain , Dr. D J Bell, senior principal scientific officer, Poultry Research Centre, Edinburgh , Dr. W. A P. Black, head of the Chemical Division of the Institute of Seaweed Research, Musselburgh , Dr. P H Davis, lecturer in the Department of Botany, University of Edinburgh , Dr W. A. Fairbairn, lecturer in the Department of Forestry, University of Edinburgh , Dr. D J Finney, reader in statistics, University of Aberdeen , Dr. P. G. Fothergill, lecturer in botany, University of Durham , Principal T. M Knox, University of St Andrews , Mr. J. Kyles, lecturer in the Department of Natural Philosophy, University of Edinburgh , Prof A. M Macbeath, Department of Mathematics, Queen's College, Dundee , Mr D. H. McIntosh, superintendent of the Observatory, Eskdalemuir, Dumfriesshire , Sir James Miller, managing director of James Miller and Partners, Ltd. , Dr. N. Miller, senior lecturer in radiochemistry, University of Edinburgh , Dr. G. H Mitchell, district geologist, Geological Survey of Great Britain (Edinburgh Office) , Dr R L Mitchell, head of the Department of Spectrochemistry, Macaulay Institute for Soil Research, Aberdeen , Prof S. D Nisbet, Department of Education, University of Glasgow , Dr A E. Oxford, head of the Department of Microbiology, Rowett Research Institute, Aberdeen , Dr H. S A Potter, senior lecturer in the Department of Mathematics, University of Aberdeen , Mr K. A. Pyefinch, Brown Trout Research Laboratory, Pitlochry , Prof R. A Rankin, Department of Mathematics, University of Glasgow , Dr. G. A. Reay, superintendent of the Torry Research Station, Aberdeen , Prof. G J Romanes, Department of Anatomy, University of Edinburgh , Prof. A. B. Stewart, Department of Agriculture, University of Aberdeen , Mr. H. B Sutherland, senior lecturer in civil engineering, University of Glasgow , and Dr D Taylor, lecturer in chemistry, University of Edinburgh.

C. V. Boys (1855–1944). Centenary Exhibition in London

The Science Museum, London, is commemorating the centenary of the birth of Sir Charles Vernon Boys (1855–1944) by a special display of instruments drawn from the permanent collections. The exhibition will be open for a period of three months, commencing on March 15, Boys's birthday. Of his manifold activities in the field of experimental physics, Boys is probably best remembered for his work on the production and properties of exceedingly fine quartz fibres. The fibres were used in the construction of a very sensitive radio-micrometer which, aided by a reflecting telescope, was capable of detecting radiation as feeble as that from the flame of a candle at a distance of almost three miles The elastic properties of quartz fibres were also utilized by Boys in designing a torsion balance with which he determined the Newtonian constant of gravitation and the mean density of the earth with an accuracy previously unattainable In addition to the original radio-micrometer and gravitational apparatus, the exhibits include Boys's lightning camera, his gas calorimeter and a number of mathematical instruments.

Optimum Use of Scientific Workers in Great Britain

In announcing in the House of Commons on March 10 the Government's acceptance of the recommendations of the Burnham Committee for the payment of special allowances to teachers of advanced work, Sir David Eccles, the Minister of Education, said that at the request of the Government the Federation of British Industries has sent a circular to the seven thousand individual firms and three hundred trade associations comprising its membership asking them to exercise restraint in bidding against the schools for science graduates. The circular states that, in discussions with the Government on the shortage of science teachers, it was pointed out to the Federation that a hopeless situation would arise if the increased remuneration for teachers was countered by a corresponding raising of salary levels by industry. The Federation agreed to put this point to its members, and the circular suggests that in this connexion firms could also review the use they make of scientific staff so as to reserve such staf for the really essential work for which they are best fitted. It is suggested that, in addition, some relief could be obtained by retaining scientific staf beyond the normal retiring age and that, if firms could help to encourage greater numbers of suitable and able boys to remain at school for a further period both industry and the schools would ultimately benefit from an increased number of science graduates The circular also states that the Government i reviewing the whole question of scientific workers in the public service so as to ensure that the best and most economical use is made of them in the nationa interest.

Chalk Lime and Allied Industries' Research Association

The first general meeting of the Chalk Lime and Allied Industries' Research Association was held on March 9 in the Association's offices at Hanove House, 73–78 High Holborn, London. The preliminary work leading to the establishment of this the latest of the research associations to be formed under the ægis of the Department of Scientific and Industrial Research, was done by the members o the Southern Lime Association As indicated by it title, the new Association will conduct co-operativ research for the chalk lime and allied industries A the meeting, Mr W. L Clarke was elected chairma of the Association and Mr M. W Hall as vice chairman. Mr. G. E. Bessey has been appointe director of research and has already taken up hi appointment Mr. Bessey was previously director o research of the Research Council of the Britis Whiting Federation and before 1949 was on the sta of the Building Research Station. Negotiations ar at present in progress for a site for laboratories and for temporary accommodation until new laboratories can be built.

University of London

THE following appointments have been made in the University of London: Prof. L. J. Kastner, professor of engineering and head of the Engineering Department, University College, Swansea, to the University chair of mechanical engineering tenable at King's College; Dr. E. A. Wright, experimental pathologist at the Medical Research Council's Experimental Radiopathology Research Unit, Hammersmith Hospital, to the University readership in pathology tenable at St. Mary's Hospital Medical School. The title of reader in electrical engineering in the University of London has been conferred on Dr. A. L. Cullen in respect of his post at University College, and that of reader in mathematics in the University of London on Dr. Winifred L. C. Sargent in respect of her post at Bedford College.

Postgraduate Awards in Agricultural Research

THE Agricultural Research Council has recently ssued a useful booklet giving details of the training rants, research studentships and fellowships which he Council is offering this year. The booklet also gives information about the openings in the agri-ultural research and advisory services. Two veterinary research fellowships of £850 a year plus uperannuation, and tenable for three years, will be open to workers holding a veterinary qualification who have had not less than three years of experience in veterinary research; and three junior agricultural esearch fellowships of £630 a year plus supernnuation, and also tenable for three years, will be pen to honours graduates with not less than three years of postgraduate experience. In addition, the Council is again offering up to thirty postgraduate raining grants and research studentships in agri-ultural and veterinary science, applications for which hould reach the Council by March 31. A copy of he booklet, free of charge, and further information an be obtained from the Secretary, Agricultural Research Council, Cunard Building, 15 Regent Street, London, S.W.1.

Efficiency of the Individual Worker: Conference in Cambridge

A RESIDENTIAL conference, to be held in Cambridge during March 31–April 3, has been arranged by the Medical Research Council with the object of discussing the latest results of research directed to mproving the efficiency of the individual worker. Sir Geoffrey Vickers will take the chair, and about a hundred and fifty delegates from industry and esearch establishments are expected. The subjects o be discussed will include the effects of environment on working capacity, the design of machinery in elation to the operator, the effects of continued or prolonged work on individual efficiency, industrial raining problems, and the use which is made of esearch results. In addition, there will be a short film, followed by a discussion, showing the way in which psychological processes and principles have elevance in daily life and industrial production. Practical demonstrations, including working models illustrating the research work which has been carried out, will also be shown. Further information can be obtained from the Medical Research Council, 38 Old Queen Street, London, S.W.1.

Announcements

THE following Royal Society Lectures will be given this year: Croonian Lecture on June 16, by Prof. C. H. Best (University of Toronto), speaking on dietary factors in the protection of the liver, kidneys, heart and other organs in experimental animals—the lipotropic agents; and Bakerian Lecture on April 28, by Prof. M. L. E. Oliphant (Australian National University, Canberra), speaking on the acceleration of charged particles to very high energies.

THE Medical Research Council is offering four Eli Lilly travelling fellowships and one Lederle travelling fellowship for work in the United States during the academic year 1955–56. The fellowships, which are worth 2,700 dollars (3,900 for a married man), are for graduates resident in Great Britain trained in research work in clinical medicine or surgery or some other branch of medical science. Application forms, to be returned by March 28, and further information can be obtained from the Secretary, Medical Research Council, 38 Old Queen Street, London, S.W.1.

THE annual conference of the Oil and Colour Chemists' Association will be held this year in Llandudno during June 7–11, and the subject for discussion will be "Film Structure and Adhesion". The conference is open to non-members. Registration forms, to be returned by April 1, and further information can be obtained from the general secretary, R. H. Hamblin, Oil and Colour Chemists' Association, Memorial Hall, Farringdon Street, London, E.C.4.

THE spring meeting of the Optical Society of America will be held in the Hotel Statler, New York City, during April 7–9, and will include a special symposium on optical molecular spectroscopy. On April 8 the Edgar D. Tillyer Medal of the Society will be presented to Prof. Adelbert Ames, jun. The meeting will be open to non-members of the Society. Further information can be obtained from the secretary of the Society, Arthur C. Hardy, Massachusetts Institute of Technology, Cambridge 39, Mass.

A CONFERENCE on starch, organized by the Arbeitsgemeinschaft Getreideforschung in conjunction with the Fachverband der Stärkeindustrie, will be held in Detmold, Germany, at the Roemer-Haus of the former organization during April 26–28. The programme will be in four parts—fundamental research, research methods, starch production and techniques, and starch derivatives. Of the twenty-two speakers, fourteen will be from outside Germany. Further information can be obtained from the Arbeitsgemeinschaft Getreideforschung e.V., Am Schützenberg 9, Detmold.

THE Association of Agriculture (52 Victoria Street, London, S.W.1) is arranging a course on "World Food: an Illustrated Study in Biology and Geography", to be held in Westham House Adult Residential College, Westham House, Barford, Warwick, during May 27–31. The fee for the course, which is fully residential, is £3 12*s*. 6*d*. Application should be made to Captain Frank Owen at Westham House.

THE annual general meeting of "Science for Peace", followed by a public conference on "Nuclear Explosions—their Long-term Effects", will be held in the Holborn Assembly Hall, John's Mews, London, W.C.1, on March 26. Further information can be obtained from the Honorary Secretary, Science for Peace, 16 Ulster Place, London, W.C.1.

BIRKENHEAD TECHNICAL COLLEGE

THE foundation stone of the new Technical College at Birkenhead was laid on May 3, 1950, by Her Majesty the Queen, now Queen Elizabeth the Queen Mother, and the College was opened officially on January 8 last by Sir Henry Cohen, a former student of Birkenhead schools who has reached eminence in his chosen profession of medicine.

The building is in the form of a letter H, one limb of which is six stories high and includes the classrooms, drawing offices, library, administrative offices, and staff and student common rooms. The limb at right angles to this is termed the 'Spine Block' and is of five stories housing the electrical engineering and science laboratories and domestic craft rooms, and the top floor is devoted to the College refectory and kitchen. The other limb, parallel to the classroom block, forms the workshop block, which is a single-story structure.

The building is steel-framed, encased in concrete with pre-cast concrete floors. It is faced with wire-cut bricks with the exception of the centre of the front, which is faced with Westmorland rough-hewn slate. The building is in three sections with expansion joints. Gauges have been fitted to show the seasonal movement. The total floor area of the College is approximately 250,000 sq. ft.

At the north end of the classroom block is the hall, which will seat approximately 1,000 and is fully equipped for theatrical purposes and can be separated from the main building for use by outside cultural organizations. There is also a gymnasium.

The College is organized in the following departments: building, commerce, domestic science, electrical engineering, mechanical engineering and science.

The building was opened for instructional purpose in September 1954, and the enrolments at the momen are more than 3,600, of whom approximately 20 are full-time, 1,100 day-release, and 2,300 evenin students.

The various departments are offering a wide rang of courses, including national certificate, highe national certificate and craft courses. Thus in th Department of Building, in addition to ordinar national certificates in building, there are City an Guilds courses in brickwork, carpentry and joinery plumbing and ships' plumbing. The Department o Commerce provides courses for national certificate in commerce, secretarial and commercial courses intermediate and final examination courses for th various professional institutions. Ordinary and highe national certificate courses, together with City an Guilds courses in electrical installation, telecommunications and radio servicing, are offered in th Department of Electrical Engineering. In th Department of Mechanical Engineering there ar courses for ordinary national diploma in mechanica engineering for seagoing engineers, ordinary an higher national certificates in mechanical engineerin with endorsement subjects, ordinary and highe national certificates in naval architecture, togethe with craft courses in workshop practice, moto vehicle mechanics' work, sheet and plate metal work welding, and foundry practice. In the Department o Science there are courses for ordinary and highe national certificates in chemistry, an intensive full time course for, and part-time courses leading to the examination for the associateship of the Roya Institute of Chemistry, a full-time intermediat

Birkenhead Technical College

pharmacy course, and a number of short courses on glass-working, instrument technology, etc , and an ordinary national certificate course in metallurgy

The College is also recognized for the award of the higher national certificate in chemical engineering.

The Domestic Studies Department covers a wide range of examination courses leading to the award of the City and Guilds or Union of Lancashire and Cheshire Institutes' certificates in cookery, dress-making, needlework, tailoring, upholstery, and the Educational Development Association certificates in basketry Bakery courses were started in September in preparation for the City and Guilds intermediate examination in bread-making and flour confectionery. Catering courses include the catering trades basic training course (City and Guilds), cookery for hotels and restaurants (City and Guilds), and catering for non-residential licensed houses

The total accommodation in the College, apart from the administrative offices, consists of forty-two classrooms, five lecture theatres, sixteen laboratories, three commerce rooms, geography room, three domestic study rooms, three craft rooms, ten workshops, a bakery and a butchery.

The first principal of the College, Mr C V. Vinten Fenton, has a staff of forty-two full-time and two hundred part-time teachers. Mr Fenton, before going to Birkenhead, was the first principal of the Peterborough College , there he was responsible for organizing technical education and saw the completion of the first phase of the new technical college built in that city.

ASLIB SCOTTISH BRANCH

ANNUAL MEETING

THE annual general meeting and one-day conference of the Scottish Branch of Aslib (Associaion of Special Libraries and Information Bureaux) was held in the Mitchell Library, Glasgow, on February 11 The first paper of the morning was given by Dr. B J A Bard, industrial manager of he National Research Development Corporation. He spoke of the work of the Corporation since its nception in 1950 and described its function as the development and exploitation, in the public interest, f inventions resulting from research carried out by overnment departments and other public bodies, nd private inventions where they are of primary mportance to the public interest Dr Bard outlined he organization of the Corporation, described how nventions are exploited and developed, and gave a eneral description of some of the projects in hand

Following this paper, there was a symposium on he treatment and circulation of periodicals. The rst speaker was Miss E Handlen, librarian of the Department of the Secretary of State for Scotland. he said that, whatever the scope of a library, two emands are common to all users want to see rticles as soon as they are published, and they want to go to the library and find articles to help with a roblem Dealing with up to two thousand titles received by the Department of the Secretary of State for Scotland, these are sorted and the date of arrival recorded, and they are then circulated according to mple circulation slips made up so that the most senior officers have priority.

In this way, periodicals are circulated around seven undred chosen users, although this figure should be trebled because officers on the lists show important articles to their juniors All, or nearly all, periodicals are brought back to the Library, preferably before a new issue arrives. To help in this circulation, the Library has specially printed cards arranged alphabetically in a tumble-card cabinet with spaces on the face for the date entries, and other more permanent information on the back (the circulation, start of run, binding, etc) This permits 'flagging' any item which needs special attention. One man can handle the work. It sometimes happens that a periodical circulated to medical men may contain an article of value to, say, a sanitary engineer The supplementary service for these fits into the general circulation scheme , the first name on circulation lists is that of the librarian, and Miss Handlen includes the odd articles in the accessions lists, so that officers who have missed circulations can borrow Such cases amount to less than ten in one month. There may be about the same number of important articles meriting inclusion in the subject card-index.

Miss Handlen favours duplication of purchase in the case of periodicals of ephemeral interest, since this permits retention of one master set and cutting of the other copies, thus saving time and labour in copying She emphasized that circulation of periodicals is necessary where there are 700 users and 29,000 issues, and that display and retention in the library would be quite impracticable Even in a smaller library, the display system would lead to loans, and loans are not as quick as circulations and are more costly in staff time. Full indexing of articles is not possible, and Miss Handlen said that full indexing often seems to defeat its own ends, being extremely cumbersome and costly for small results Finally, she asked if there is not a danger of a librarian coming too much between the user and the holdings She felt that librarianship is in danger of becoming an esoteric clerical job if too much is attempted in the way of carding every reference Miss Handlen said that she would rather contribute £25 a year to an abstracting journal to help it become more efficient and up to date in publication than pay £500 to an extra assistant to anticipate the abstracts.

The second speaker in the symposium was Mr. A Liddle, librarian to the firm of Babcock and Wilcox, Ltd , who described the controlled circulation of a hundred and forty periodical titles to approximately a hundred and twenty readers, most of whom are within the firm's research station The circulation slips affixed to the periodical have columns for name, department, see pages, date sent, returned and initials A section is provided for readers to note that they wish pages to be abstracted and indexed in the central file. Normally, periodicals are displayed for seven days so that anyone can add their name to the circulation list, or delete it if it is already there and that issue is not of further interest Mr Liddle thought that the time necessary for recording is justifiable by results and described the visible card system used To help in the service of getting information to users as quickly as possible, the periodicals are first scanned and items of current interest are abstracted and produced in the form of a weekly bulletin

The third speaker in the symposium was Mr J. R K Pirie, librarian of the Mechanical Engineering Research Laboratory, East Kilbride, of the Department of Scientific and Industrial Research. He outlined the difficulty of circulating three hundred and fifty periodicals to staff housed in several buildings, one set being more than four miles from the main central library. The staff have been asked which periodicals they wish to see, and only nineteen were asked for by more than eight readers; circulation lists were then drawn up. Periodicals are normally displayed for seven days, allowing members of staff to scan and delete their names from the lists if there is nothing of interest. Circulation priority is arranged into the categories of 'urgent', 'personal' and 'departmental'. The system of recording is that described by its designer, Miss Ruth Jacobs (then of the Department of Scientific and Industrial Research), in the *Journal of Documentation*, 6 (4), 213 (1950). Names of borrowers are grouped, so that periodicals are returned to the library after every three or four names for checking.

The afternoon session was devoted to a paper by Mr. F. W. Gravell, librarian of the Patent Office. He spoke of the purpose and process of patenting an invention, and described the scope and work of the Patent Office Library. The full text of the papers by Dr. Bard and Mr. Gravell will be published in *Aslib Proceedings* in due course. MARGARET SPENCE

LINEN INDUSTRY RESEARCH ASSOCIATION

AT the thirty-fifth annual general meeting of the Linen Industry Research Association on December 17, 1954, both the chairman, Mr. H. B. McCance, and Mr. N. V. Cooke, in proposing and seconding the motion to adopt the report of the council and the accounts, stressed the importance of making sure that the industry gets the best value for the expenditure of £70,000 a year on research. Mr. McCance urged that research should be concentrated on a few well-defined objectives of such importance that the industry would at once provide the whole of the money required if the government contribution were withdrawn. Mr. Cooke emphasized the importance of securing staff of outstanding ability and especially with imagination, at least some of whom should come from outside the industry. This point was welcomed by the director of research, Dr. A. J. Turner, who also stressed the value of those of the staff who had been appointed for their technical knowledge and experience. Most of the present staff had come to the Association with no previous knowledge of textiles; but the Association is still trying to obtain one or two more senior men of the type Mr. Cooke considers necessary.

In reviewing the year's work Dr. Turner said that we are in the throes of a new industrial revolution arising out of the modern advances in physics and chemistry. In so far as the linen industry is still a craft industry, a great struggle is involved in trying to prevent it from shrinking further in competition with the man-made fibres. It will be necessary to attempt to process specially selected man-made fibres on flax machinery to obtain special effects and novelties. The linen industry of the future can be transformed so as to include the man-made staple fibres, and unique blends of such fibres with one another or with flax can be made into new and readily saleable cloths. Little work is at present being done by the Association on flax production. In the spinning departments the most interesting fundamental research is that on yarn irregularity. Dr. Turner also referred to the value of starch ethers and cellulose ethers as sizing agents for linen yarns; but the advances in polymer chemistry have been most keenly felt in the chemistry department, particularly as regards special proofing finishes, and the possibilities are far from being exhausted.

The report of the Council of the Linen Industry Research Association for the year ended September 30, 1954*, records a slight fall in membership, from 285 to 281, and regrets also the decision by the Government to terminate, on economic grounds, the Home Flax Production Scheme. There has also been a large contraction in the flax acreage in Northern Ireland, where tank retting has almost ceased, and in consequence research work on tank retting problems has been suspended. Research work on spinning has resulted in mechanical modifications for improving the operation of drawing frames and in recommendations for improving the control of yarn quality and the efficiency. A new system has been developed for controlling the levelness of drafting, and the study of the strength relation of yarns and cloths has enabled the necessary yarn strengths to be predicted when making cloths of certain specification. A new test has been devised for measuring the absorbency of cloth during the first few seconds of contact with a wet surface, and promising results have been obtained in factory trials with some new sizing materials. A prototype production model of the new spool winder, which makes packages suitable for overend unwinding, is now being built; much attention has been given to proofing linen fabrics, and improvements have been made in waterproofing flax canvases with pigmented drying oils and with oils and waxes applied from emulsions.

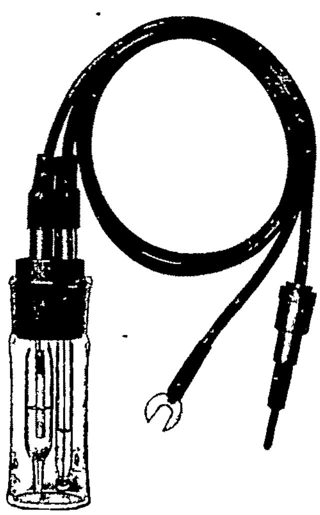
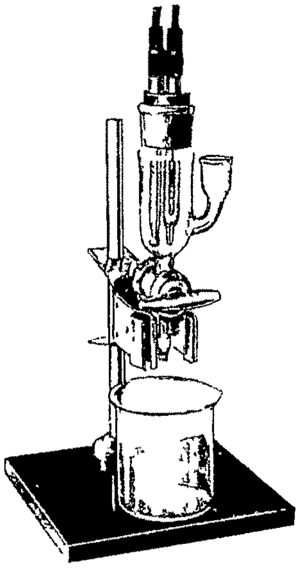
APPARENT HETEROGENEITY OF DEOXYRIBONUCLEIC ACID: SEDIMENTATION EXPERIMENTS AT LOW CONCENTRATIONS

By DR. K. V. SHOOTER and PROF. J. A. V. BUTLER

Chester Beatty Research Institute, Institute of Cancer Research: Royal Cancer Hospital, Fulham Road, London, S.W.3

SEDIMENTATION experiments with deoxyribonucleic acid, using the Philpot–Svensson[1] optical system, can be carried out at concentrations down to 5×10^{-4} gm./ml. Although at this concentration only a slight spreading of the peak is observed[2], this cannot be taken as an indication of the homogeneity of the material, since it is known from light-scattering measurements[3] that interaction between the molecules only becomes small at concentrations less than 3×10^{-5} gm./ml. The strong absorption in the ultra-violet shown by solutions of deoxyribonucleic acid can be used to measure the rate of sedimentation at concentrations down to 10^{-5} gm./ml. The results discussed in this communication refer to various dilutions of three different stock solutions prepared from one preparation (DNA7)[4]. 0·02–0·04 per cent of deoxyribonucleic acid was dissolved in water for twenty-four hours and then diluted with an equal volume of 0·4 *M* sodium chloride. These solutions





DORAN

pH ELECTRODES

The Dual Alkacid electrode as illustrated on the left has been adopted almost universally as a convenient, reliable and robust unit. The Micro Alkacid electrode used in conjunction with the Micro Calomel Element covers a range of 0–13 pH and is linear to within ± 0·01 pH unit These electrodes are mounted in a bakelite stopper which fits a C24 ground glass socket and they are strictly interchangeable For convenience the Electrode Vessel shown on the right, or a similar vessel arranged for continuous flowing solutions, may be used with the same Micro Electrode Assembly. A third hole in the bakelite stopper permits the use of a thermometer or the temperature compensator element supplied with the Doran Universal pH Meter. These and other electrodes are illustrated and described in our List 117, a copy of which will gladly be sent on request

Abraham Wald

Selected Papers in Probability and Statistics

Born in Rumania in 1902, Wald studied mathematics at the University of Vienna In 1938 he emigrated to the United States as Fellow of the Cowles Commission for Research in Economics. In the following autumn he went to Columbia University to study modern statistical inference under Hotelling; there he was appointed Professor of Economics in 1944.

The present volume endeavours to place his career in its proper perspective Beginning with a brief biographical sketch, it presents a collection of most of his work —his papers on Decision Function Theory; Probability, Research in Nonparametric Inference; The Neyman-Pearson System of Statistical Inference; The Theory of Regression and Analysis of Variance. Wald's different papers are inter-related to each other, and to the work of others They therefore provide a survey of the wide range of areas in which he made original contributions.

Degradation of Vinyl Polymers

By H H G JELLINEK
University of Adelaide, South Australia

(Volume III of PHYSICAL CHEMISTRY · A Series of Monographs
Edited by Eric Hutchinson)

January 1955
329 pp , illus , 68s.

The present book is written mainly from the standpoint of reaction kinetics. The fundamental aspects of the kinetics of degradation are considered in detail. The first chapter, which presents a discussion of formal kinetic theories of degradation, not only has a bearing on vinyl polymers, but also should be of wider interest. The second chapter deals with experimental data on the bulk degradation *in vacuo* Not only are these data discussed on the basis of the formal kinetic theories, but possible actual mechanisms are also considered. Experimental data and theories of degradation in solution and under the influence of oxygen, catalysts, and various chemicals are treated in the third chapter Mechanical degradation and degradation by ultrasonic waves are considered in the last chapter The importance of cavitation for the latter type of degradation is discussed Most recent developments, such as degradation by high energy radiation (x-rays, γ-rays, nuclear pile radiation) are discussed in an appendix.

CONTENTS :

Formal Mathematical Theories of Degradation
Bulk Degradation *in Vacuo*
Degradation in Solution and Oxidative Degradation
Mechanical and Ultrasonic Degradation

MACMILLAN BOOKS

A Text-book of Electricity and Magnetism

G. R. NOAKES, M.A., F.Inst P.

This is the new, Third Edition of a book which will meet the need of those taking Intermediate degree courses and the Advanced and Scholarship Examinations of the General Certificate of Education. All the usual topics required at this stage are dealt with, and where necessary calculus is used Among the special topics discussed are the conduction of electricity through gases, atomic physics and modern views on ferro- and terrestrial magnetism. *Third Edition.* 14*s.*

Advanced Level Examples in Physics

R. V. JOHNS, M A., B Sc.

Lecturer in Physics and Mathematics, City of Liverpool College of Technology

W. F WARE, B Sc., A Inst P.

Senior Physics Master, Cathays High School for Boys, Cardiff

This book of numerical examples is designed to supplement the theoretical and laboratory work of students preparing for examinations in Physics at the Advanced level of the General Certificate of Education and for Intermediate Degree examinations. Some 1,000 examples have been arranged by topics and carefully graded in difficulty Contents are arranged under the headings Mechanics and Properties of Matter, Heat, Light, Sound, and Magnetism and Electricity. 16*s.*

Fluid Dynamics of Jets

SHIH-I PAI, Ph.D.

University of Maryland

Recent rapid developments in jet- and rocket-propelled missiles and aircraft has led to an increased interest in the nature of the flow field of jets. This book on fluid dynamics, while including a discussion of modern developments, thoroughly covers jet flow from fundamentals to such advanced topics as the laminar flow and the turbulent flow of compressible fluid and properties of turbulence fluctuations 37*s.* 6*d*

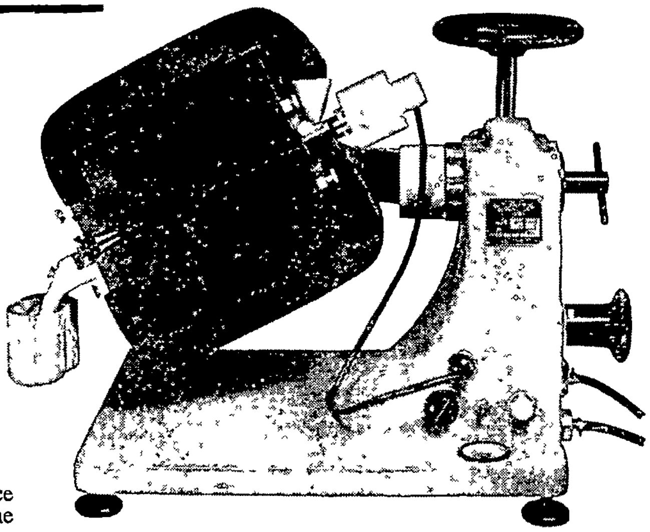
FRANTZ ISODYNAMIC Magnetic SEPARATOR



* *"A magnificent adjunct to heavy-liquid separation and to quantitative mineragraphy as a tool for the mineral investigator."*

This is the original Isodynamic Separator, made since 1936 and used throughout the world It combines the highest power with the most delicate discrimination, enabling separation of very feebly magnetic minerals, even when their susceptibilities are very close together A typical series separated is

Magnetite ilmenite muscovite . . . tourmaline . . monozite rutile zircon.

* AIME Tech Pub No 1549, "Magnetic Separation of Sulphide Minerals", by A M Gaudin and H R Spedden Copy on request

The magnet is supported adjustably on a massive cast iron base, into which are built the controls for the magnet current and for the vibrator, as well as an ammeter and all the necessary switches.

The Isodynamic Separator shown (with slope feed arrangements) is offered optionally without vertical feed at a substantial saving in price Deliveries of new lot starting April 1955.

45% greater capacity

cuts filing costs . . .

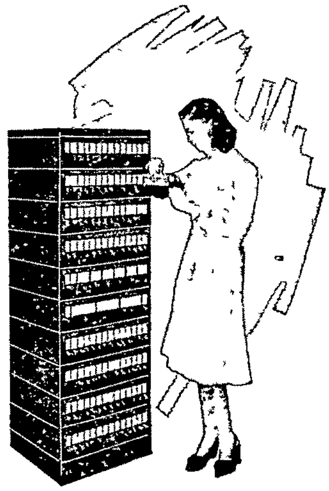
saves floor space

Single 'LAB AID' section holding two 1" drawers, two 2" drawers (for wide slides, color transparencies, etc) and two 4" drawers (for lantern slides, cards, etc)

How can a Technicon "LAB-AID" filing cabinet measuring only 19" square by 5" high hold up to 6500 (average) one-inch microslides? The single section illustrated here with its drawers extended will show you why . . it's because there are no thick bulkheads between drawers — no space-consuming buttresses, no bulky tracking guides Yet, close-set as they are, every drawer slides straight and true easily, smoothly, without binding.

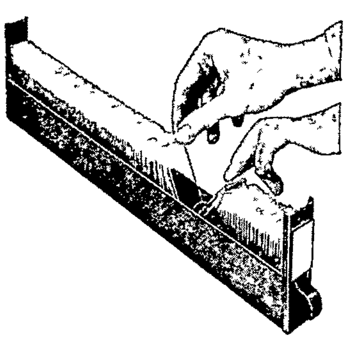
Drawers are freely interchangeable, too, thanks to the unique "LAB-AID" unit-gauge track system, so that you can intermix 1" drawers with 2" drawers (even 4" drawers, if you like) according to your needs

Staunch, fireproof "LAB-AID" units are strongly built of heavy gauge steel for a lifetime of satisfactory use Beautifully finished in olive green enamel, with combination drawer-pulls and label holders Separate bases and finishing cap panels make complete units of any number of sections your filing needs require, expandable at will at any future time.



A stack of ten sections, complete with base and cap panel Interlocking design lets you pile sections right up to the ceiling Staunch 'LAB AID' construction easily bears the heavy weight of solidly packed slides

For filing current slides, the removable spring separator lets you riffle through them as easily as you flip the pages of a book easy to file, easy to find Slip it in when you need it, take it out when you use the drawer for storage filing



TECHNICON

Lab-aid **laboratory filing cabinets**

Technicon "LAB-AID" filing cabinets have long been standard filing equipment in laboratories throughout the world Now made in France, they can be easily imported into the United Kingdom.

new, arresting
STANTON 'Synchro-Release'
...controls
release
AND arrestment...
brings knives and bearings smoothly into contact without impact
-independently of the user

The most careful chemist could not release a balance more smoothly than the Stanton "Synchro-Release" device So gently controlled is the automatic motion of the "Synchro-Release" mechanism that knife edges and bearings are brought into contact swiftly, safely, accurately, without the slightest jarring or vibration of impact no matter how hurried or unskilled the operator may be

ALL Stanton balances can now be supplied with "Synchro-Release" giving these extra advantages —

- **Safely controls arrestment as well as release.**
- **No loss in weighing time.**
- **Ensures sustained accuracy on routine weighings**
- **Simple, sturdy synchronous device—nothing to go wrong.**
- **Facilitates training of laboratory personnel.**
- **Reduces balance operating costs.**

SEND TO-DAY *for illustrated leaflet giving full details of this amazing new improvement*

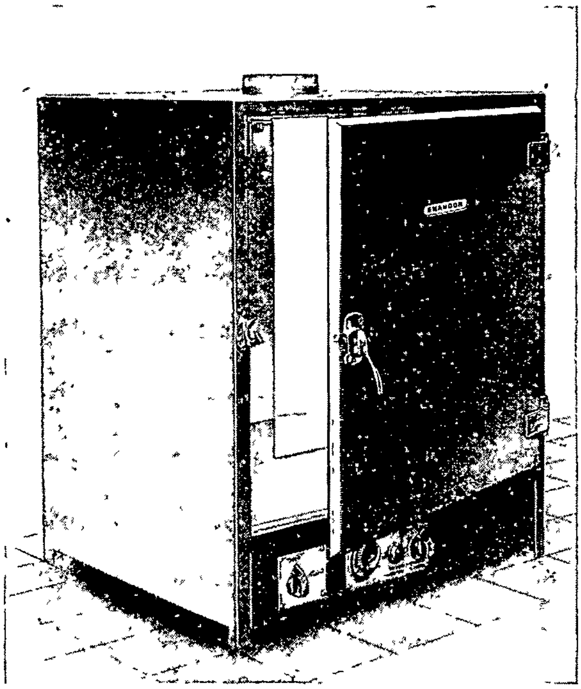
SHANDON

CHROMATOGRAPHY DRYING OVEN



Specially designed for chromatography and paper electrophoresis, this Shandon equipment offers

- ★ Drying of papers at **uniform temperatures,** a feature which is **indispensable for consistently accurate, reproducible, and comparable chromatograms.**
- ★ Simultaneous drying of **12 large sheets up to 24 in × 24 in.,** hung on **pull-out rack** giving free access to all papers
- ★ Heating of all papers under strictly identical conditions through continuous horizontal **forced air circulation** by centrifugal fan
- ★ Accurately **controlled heating** from ambient temperature to **150° C.** by manual or fully automatic regulation
- ★ **Solvent vapours continually exhausted** through adjustable outlet (*The oven can also be run as a closed system*)
- ★ Shelves are available for immediate conversion into **general purpose laboratory oven.**

"Whatever do you use all this Glass Tubing for?..."

" Oh, that's 'PYREX' for all sorts of things, from gauge glasses to heat exchangers, from hypodermic syringes to condensers, and we are now buying large supplies of special thin wall tubing for the manufacture of B.S. Ampoules "

" Surely 'PYREX' tubing can't be made thin enough for ampoule work!"

" Oh yes, it can. We are buying it with a wall thickness down to point four millimetres. The great advantage, of course, is that its heat and chemical resistant properties reduce the losses in sealing the ampoules, and give added protection to the contents "

- 'PYREX' *Brand Tubing, which is of the same composition as* 'PYREX' *Laboratory ware, is supplied in standard, heavy and extra heavy wall grades, in diameters ranging from 3 to 100 mm. Special Thin Wall Tubing is available for the manufacture of Ampoules, and Precision Bore Tubing from 1.5 mm to 42 mm bore is available with bore tolerances of ±0.05 mm. For special purposes, Precision Bore Tubing with tolerances of ±0.02 mm can be supplied*

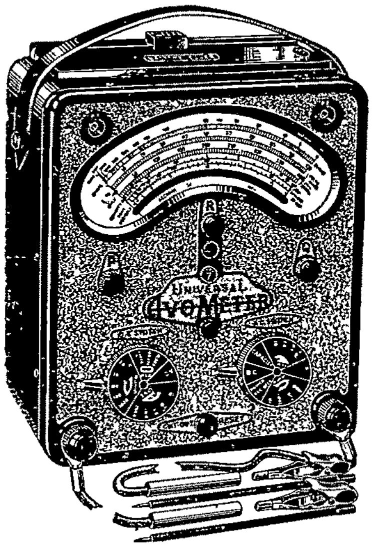
Instrumentally Speaking

Wherever electricity is used in industry, there is a need for electrical measuring instruments. Phenomenal development in the war and post-war years has produced a need for such a multiplicity of instruments of different kinds that there is a prevailing tendency towards the slowing down of maintenance and laboratory work through having too many instruments in use. Incidentally, too much test gear also means too much expense. The answer to such problems is provided by "Avo" MULTI-RANGE instruments.



The Model 7 Universal AvoMeter is a typical example of a modern "AVO" multi-range meter It is a combination A C /D C instrument providing on a 5-inch hand calibrated scale 50 ranges of readings of Current, Voltage, Resistance, Capacitance, Power Output and Decibels The total resistance of the instrument is 500,000 ohms, and its small power consumption and precision accuracy make it the choice of radio, television and electrical engineers throughout the world An external accessory is also available for measuring Power and Power Factor

THERMOSTATIC WATER BATHS MADE BY GRANT INSTRUMENTS

(1) Cover the range from 10° to 90° C., with a differential of ± 0 25° C. The whole range is clearly marked out on the dial, in single degrees, and the required temperature can be precisely set

(2) Are fitted with an accurate bimetallic thermostat, of new design, which works on the micro-switch principle without a relay and without arcing at the contacts

(3) Have extremely efficient stirring, by induction motor, which ensures that there is no measurable temperature gradient throughout the bath.

(4) Have 1500 or 3000 watt heaters which give very rapid heating

(5) Can now be fitted with fan cooling to the control box, recommended for continuous operation over 40° C , to prevent overheating and condensation

(6) Are protected by a strong wooden casing, with air gap, giving good heat insulation.

(7) Are unconditionally guaranteed for 12 months, and covered by a 48 hour repair service

were then further diluted with 0 2 M sodium chloride to obtain the very low concentrations used. The experiments have been carried out with the 'Spinco' model E ultracentrifuge fitted with an ultra-violet absorption observation system working in the wavelength region 248–265μ

We have found that at concentrations of deoxyribonucleic acid less than 1 × 10^{-4} gm /ml the boundary shows a very marked degree of spreading The essential problem at these low concentrations is to determine whether this is due to the inherent instability of the boundary, or whether it corresponds to a real heterogeneity of sedimentation coefficients We have used two criteria to determine whether the boundary is stable.

First, the calculated sedimentation coefficients should be reproducible and should increase steadily as the concentration of deoxyribonucleic acid is reduced As is shown in Fig 1, the reproducibility of the results is of the order of ± 10 per cent At concentrations less than 5 × 10^{-5} gm /ml. the sedimentation coefficients are somewhat lower than expected, and this and other evidence given later suggests that at such concentrations the boundary is not stable. The mean sedimentation constant at zero concentration is about 24 S. This value is higher than has been previously found by extrapolation from results obtained at higher concentrations[2,3,5].

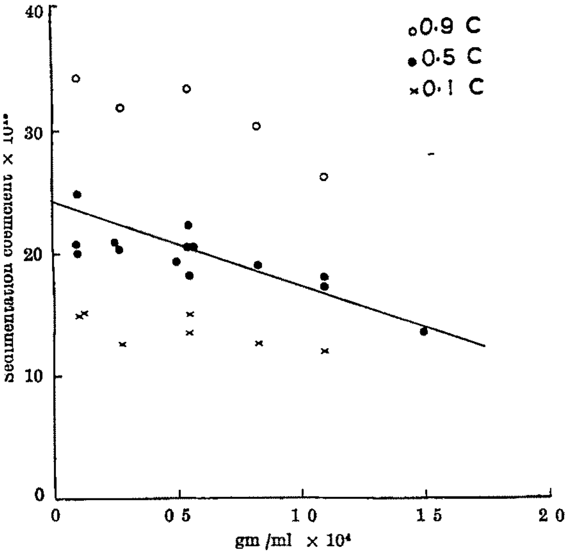

Fig 1 Variation of the sedimentation coefficient with concentration deoxyribonucleic acid in 0 2 M sodium chloride

A second and more definite criterion that we have used is to determine whether the spreading of the boundary, in terms of sedimentation coefficients, changes with time of sedimentation. When sedimentation begins, the boundary is at the meniscus (a distance x_0 from the centre of rotation), and is nfinitely sharp After a time of sedimentation (t), the distance from the centre of rotation to points in the boundary where the concentration is 0 1, 0 5 and 0 9 of the total concentration has been measured x) If the boundary remains undisturbed during sedimentation, then a plot of log x versus t should give a straight line for each concentration, and the three lines should extrapolate to a point at log x = og x_0. It has been found that at concentrations down to 5 × 10^{-5} gm./ml deoxyribonucleic acid this test shows that the boundary is stable (Fig 2) At lower concentrations, although the points fit straight-line plots fairly well, the three lines do not converge to a point at log x_0. The main cause of the instability of the boundary will be the stirring effects of thermal currents, and these will be most marked during the adiabatic cooling of the rotor during acceleration[6,7]. These results also show that the spreading due to diffusion is negligible in these experiments.

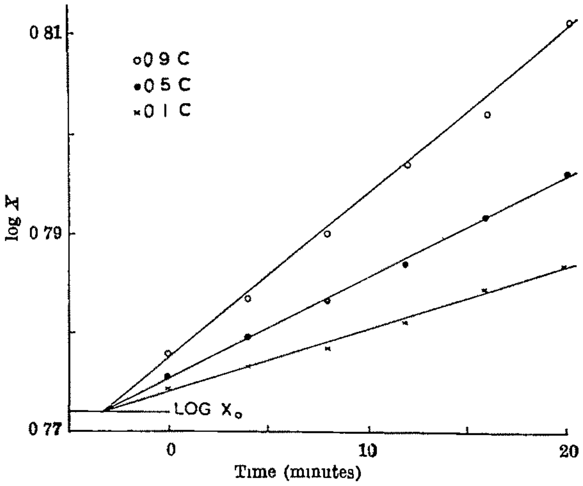

Fig 2 5 5 × 10^{-4} gm deoxyribonucleic acid/ml in 0 2 M sodium chloride the slopes of the lines give the sedimentation coefficients for concentrations 0 1, 0 5 and 0 9 times the total concentration

These results have been further analysed to determine the distribution of sedimentation coefficients From the photographs taken during sedimentation, the plot of optical density of the solution versus distance down the cell is obtained. This can be transposed to a plot of optical density versus sedimentation coefficient, and the first derivative of this curve gives an apparent sedimentation distribution. The correction for dilution resulting from sedimentation in a sector-shaped cell is applied at this stage[8]. Fig. 3 shows the distribution diagrams obtained for solutions containing 11 and 5 5 × 10^{-5} gm./ml deoxyribonucleic acid. It is obvious that the deoxyribonucleic acid preparation is extremely heterogeneous. If it is assumed that for each molecular species the absorption is proportional to concentration, then the ordinates of Fig 3 give the weight-fraction of the deoxyribonucleic acid having a particular sedimentation coefficient. Comparison of the shapes of the two distributions in Fig. 3 shows that at 11 × 10^{-5} gm /ml. some self-sharpening of the boundary due to the Johnston–Ogston[9] effect occurs, whereas at the lower concentration there is no obvious self-sharpening of the boundary. Since, however, interaction may still occur at the lower concentration, the curve of Fig. 3 may not represent the true distribution of sedimentation constants. It may be noted that for a system consisting of rigid

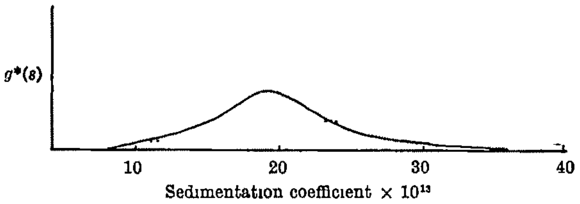

Fig 3 Apparent distribution curves for deoxyribonucleic acid, full line, 11 × 10^{-5} gm /ml , dotted line, 5 5 × 10^{-5} gm /ml

rods of constant cross-section, the sedimentation coefficient should be almost independent of the length of the rods[8]. The marked heterogeneity of sedimentation constants found suggests that either the deoxyribonucleic acid molecules are to some extent flexible or that their diameter is variable, possibly as a result of aggregation. The effect of aggregation and other types of interaction that occur in this region of concentration requires further investigation before unambiguous conclusions as to the meaning of the heterogeneity can be drawn.

This investigation has been supported by grants to the Royal Cancer Hospital and Chester Beatty Research Institute from the British Empire Cancer Campaign, the Jane Coffin Childs Memorial Fund for Medical Research, the Anna Fuller Fund, and the National Cancer Institute of the National Institutes of Health, U.S. Public Health Services. DISTRIBUTION OF RADIO BRIGHTNESS ACROSS THE ANDROMEDA NEBULA

By Prof. JOHN D. KRAUS

Radio Observatory, Dept. of Electrical Engineering, Ohio State University

USING the 96-helix antenna and improved receiver of the Ohio State University radio telescope (Kraus and Stoutenburg, in preparation), observations have been made of the radio brightness across the Andromeda nebula (*M*31) at 250 Mc./sec. A radio source near the nebula's position was detected by Ryle, Smith and Elsmore[1] at Cambridge about 1950. However, it remained for Hanbury Brown and Hazard[2] at Manchester in 1950 to make the first positive identification of a radio source with the nebula. Their observations stand as an epic achievement of radio astronomy, since it was the first radio source to be definitely identified with an extragalactic object.

The Andromeda nebula is a galactic system similar to the galaxy in which we are located. It is classified as an *Sb*-type spiral nebula with its axis tilted about 75° from our direction. At a distance of one and one-half million light years, this sister system is a weak radio source and was near the limits of detection of the Manchester radio telescope. At Ohio it was detected with a much smaller, although more efficient, antenna with less resolution in declination but higher resolution in right ascension than the Manchester antenna. The Ohio antenna is 160 ft. long (east–west) and 22 ft. wide (north–south), with an aperture area of 3,520 sq. ft., and operates as a meridian circle instrument. The Manchester antenna, a fixed paraboloid 218 ft. in diameter with an aperture of 37,400 sq. ft., is more than ten times as large.

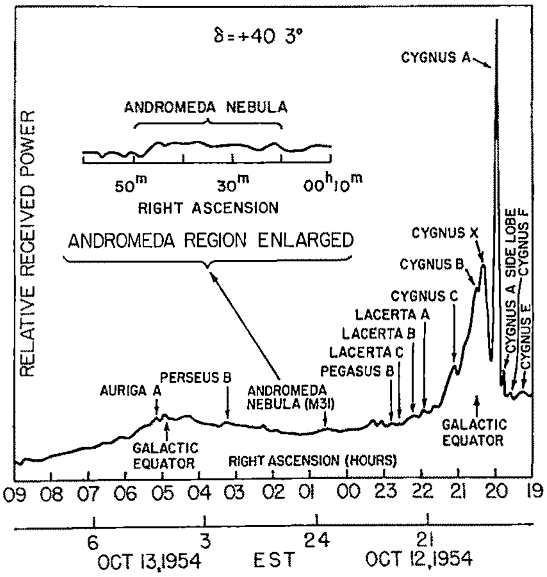

Fig. 1. Single profile taken with the Ohio State University radio telescope on the night of October 12–13, 1954. The largest peak is due to the radio source Cygnus *A*. The Andromeda nebula appears as a small hump near R.A. 00h. 40m. The insert shows the Andromeda region to a larger scale

The Andromeda nebula is situated in a minimum of the cosmic radio background. This is illustrated by Fig. 1, which is a profile of the received power versus time (or right ascension) as obtained with the Ohio State radio telescope on the night of October 12–13, 1954, at a declination of 40 3° N. A large rise near R.A. 20h. 30m. and another smaller one near R.A. 05h. 00m. occur at the galactic equator. The Andromeda nebula is in the valley between them.

The most prominent peak in Fig. 1 is due to the radio source Cygnus *A*. A number of other localized sources[3] are also designated by name. The insert in Fig. 1 is an enlargement of the profile for the Andromeda nebula region showing the record for the night of October 12 to a larger scale.

By averaging six profiles taken at Dec. 41° N. ± 0 7° between October 11 and 17, 1954, it was possible to reduce the random fluctuation of the profile by a factor of approximately 2 5 (= $\sqrt{6}$). This averaged profile (radio brightness) is shown at the top of Fig. 2. This curve indicates that although the radio emission from the nebula is strongest between R.A. 00h. 27m. and 00h. 45m., there is a suggestion of emission out to R.A. 00h. 20m. on the preceding side and to 00h. 51m. on the following side. The slowly varying background gradient has been subtracted from this curve.

For comparison, smoothed contours of optical brightness (isophotes) of the Andromeda nebula are shown at the centre of Fig. 2 as measured by Williams and Hiltner[4]. It is apparent that the strongest part of the radio emission (marked "main body") corresponds in position to the region enclosed by their isophote contour 2. The curve at the bottom of Fig. 2 labelled "photographic brightness" shows how the nebula would appear optically to a device having the same response pattern as our antenna, assuming a uniform optical emission from the region within contour 2. The curve was obtained by moving the

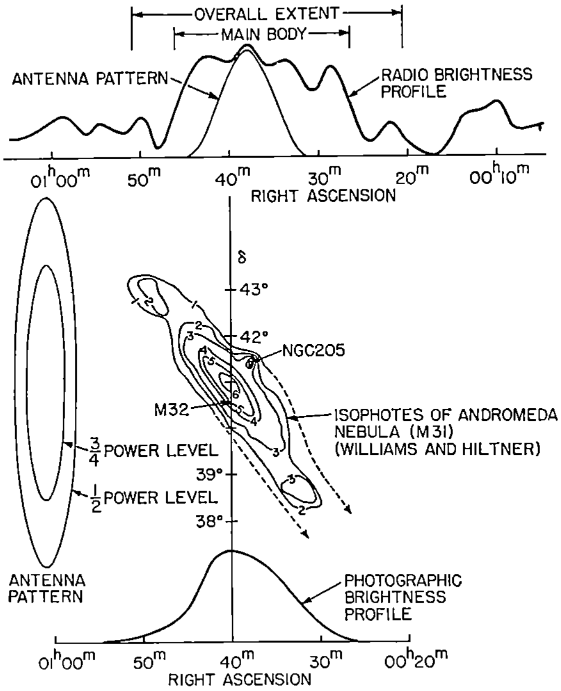

Fig 2 Radio brightness profile (top curve) across the Andromeda nebula obtained by averaging six records taken with the Ohio State University radio telescope at a declination of approximately 41° N The ordinate is relative radio brightness Isophotes for *M*31 as measured by Williams and Hiltner are shown at the centre with a photographic brightness profile (bottom curve) that would be observed with an optical system having the same response pattern as our antenna

antenna pattern (at left of Fig 2) along the Dec 41° N. line across the contour of the nebula and computing graphically the received intensity at successive positions The antenna pattern (for a point source) is 1·3° wide between half-power points in right ascension and 8° wide in declination The wide beam-width in declination is sufficient to bring all contour 2 within the half-power level when the antenna is at Dec. 41° N.

The optical brightness actually increases toward the nucleus (at R A. 00h 40m), as shown by the higher contour levels, so that the assumption of uniform emission inside contour 2 should increase the extent of the nebula as shown by the normalized photographic brightness curve In spite of this fact, the photographic brightness curve shows a smaller extent for the nebula than does the radio brightness curve, indicating that the radio emission must be much larger in the outer regions of the nebula than the optical brightness would suggest Furthermore, the ratio of the radio to photographic brightness for the outer regions must be much higher than the ratio of the radio to photographic intensity for the nebula as a whole

The amount of significance that can be attached to the small peaks near R A 00h 22m., 29m. and 50m is not certain. However, the outer ones are sufficiently separated to be due to small areas or bands of emission which can just be resolved by our antenna (1·3° resolution) It is probable that a small increase in resolution would reveal considerably more such fine structure

Since the nucleus of Andromeda *M*31 is close to R A. 00h. 40m at Dec. 41° N , the radio brightness distribution indicates that the nebula is quite asymmetrical The main body appears to extend 3·5° from the nucleus to the south-preceding side and 1·7° to the north-following side. This extent agrees closely with that of Williams and Hiltner's contour 2. If the peaks on the radio brightness curve at R.A. 00h 22m. and 50m. are significant, it indicates an approximate overall extent of the nebula of 6° to the south-preceding side and 3° to the north-following side (ratio 2/1), giving an overall diameter of 9° At a distance of 1·63 million light years (new scale)[5] this means an overall diameter for the nebula of 256,000 light years

From their isophotes, Williams[4] and Hiltner indicated that the extent of the nebula was at least 6·7° Their contour 1 was found to extend so far to the south-preceding side that they could not close it on the original negative and it is shown only in part (solid line) , the broken line suggests what is presumed to be the general trend of this contour beyond the extent given by Williams and Hiltner. The extent of the Andromeda nebula usually seen on a photograph is about 2°, corresponding to Williams and Hiltner's contour 4 or 5

Preliminary attempts have been made to construct a model of *M*31 to fit the radio brightness contours of Fig 2 It is readily possible to obtain an approximate fit by assuming a structure of eccentric emitting rings of increasing size with gaps between them that are especially large for the outermost rings.

In addition to the measurements reported above, profiles across *M*31 were made with the Ohio State University radio telescope later in October at Dec 44° and 37·5° N. At Dec. 44° N , the main part of the rise in the brightness curve is about 5 min. later than at Dec. 41° N., while at 37·5° it occurs about 5 min. earlier. By the dates of the 44° and 37·5° observations, the transit time of *M*31 was sufficiently early in the evening for interference to be experienced on most nights from frequency-modulation broadcasting stations. Accordingly, only a few good profiles were obtained at these declinations.

The minimum signal that can be detected by our radio telescope corresponds to a randomly polarized incident intensity of about 7×10^{-26} W m $^{-2}$ (c /sec)$^{-1}$ for a single record. The maximum observed intensity of *M*31 (near R.A 00h. 40m) is about $2·5 \times 10^{-25}$ W. m.$^{-2}$ (c /sec.)$^{-1}$. This includes both polarizations. The total intensity is about four times this value, which makes the total radio intensity of *M*31 at 250 Mc /sec. approximately equal to 10^{-24} W. m $^{-2}$ (c./sec)$^{-1}$. Hanbury Brown and Hazard[2] found the same total intensity at 159 Mc /sec. It might be expected that the intensity of *M*31 at 250 Mc./sec. would be approximately 0·63 (= 159/250) as much, instead of the same value However, this may be explained by integration over a larger source area in the present case.

I am indebted to Geoffrey Keller for helpful discussions and to Donn Van Stoutenburg and Gabriel Skitek for assistance in improving the telescope receiver The radio telescope project is supported by grants from the Development Fund, the Lovejoy Memorial Fund, and the fund for basic research of the Ohio State University and also by a grant from the National Science Foundation [Nov 4

Lung Injury by Impact with a Water Surface

Medical findings during the inquiry into the recent *Comet* disasters have suggested that the possibility of lung damage by impact with a water surface at the terminal velocity of fall (about 160 ft /sec) should be investigated It is known from observations on the effects of explosive blast that severe lung damage occurs when the impulse communicated to the chest wall exceeds a certain limit Penney and Bickley (unpublished report, Min of Home Security, 1943), after a study of the work of Zuckerman and his collaborators[1] on blast injury, suggested that the lungs of man or any animal would be severely injured by transmission of the shock wave set up if the chest wall were flung inwards with a velocity of 20 m /sec (66 ft /sec) acquired in 0 5 m sec. or less

Work by E G Richardson[2] on the impact of rigid spheres with a water surface may be applied in an attempt to estimate the velocity of impact which might be expected to produce the chest-wall motion specified by Penney and Bickley as being critical. Richardson measured the variation with time of the force of impact, showing that it rises to a peak and becomes relatively small again by the time semi-immersion has been reached He found his results to be reasonably consistent with the assumption that at any particular instant the sphere carried with it an 'added mass' of water equal to that in a hemisphere erected on the wetted perimeter

In applying this method of calculation to a non-rigid body, such as the chest of an animal, it will be assumed first that only the motion of that part actually in contact with the water is modified by the impact, this appears reasonable for the relatively small displacements of the chest wall visualized by Penney and Bickley. Assuming further that the chest is a sphere (radius a) and that the radius of the wetted perimeter is c at the instant considered, conservation of momentum between the part of the chest wall immersed and the 'added mass' of water gives approximately

$$\pi c^2 \mu V = \pi c^2 \mu v - \tfrac{2}{3}\pi c^3 \rho v$$

where V is the incident velocity, v is the velocity of the immersed part of the chest wall of mass μ per unit area, and ρ is the density of the liquid. The inward velocity of the immersed part of the chest wall with respect to the rest of the body must be $V - v$ $(= v_c)$, so that the above equation becomes

$$V/v_c = 1 + 3\mu/2c\rho \qquad (1)$$

If v_c be taken as 66 ft./sec., the corresponding value of V should then be the critical velocity of impact for severe lung damage, according to Penney and Bickley's ideas

Apart from the approximations made in its deduction, equation (1) can only provide a very rough estimate of the critical velocity of impact for a given animal, because the result of any calculation must depend on the value of c chosen to correspond to a significant area of contact with the water If the value $a/\sqrt{2}$ be arbitrarily assigned to c (that is, πc^2 is half the total area of cross-section) the critical velocity of impact is 99 ft./sec for a guinea pig ($\mu = 0$ 7 gm /cm ^{2}, $a = 3$ cm), 118 ft /sec. for a mous ($\mu = 0$ 3 gm /cm ^{2}, $a = 0$ 8 cm) and 94 ft /sec. fo a man ($\mu = 3$ gm./cm ^{2}, $a = 15$ cm). In each cas the body is assumed to be of similar shape, offerin a similar aspect to the water surface at the momen of impact, and the possibility of protection by thic fur, limbs or clothing has been neglected. The value of μ and a cannot be chosen very precisely, but th critical velocity, as calculated by equation (1), is o the same order for a wide range of size of anima because both μ and a should be roughly proportiona to the cube root of body-weight

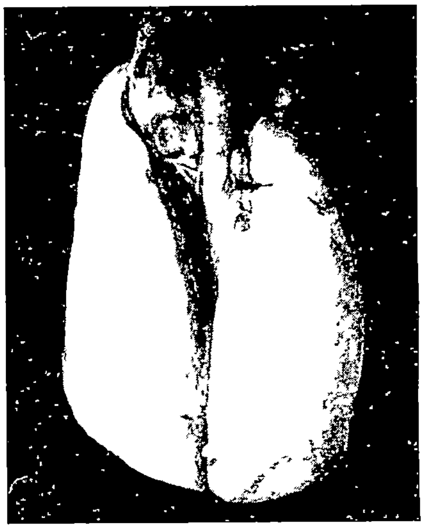

Fig 1 Lungs of a normal guinea pig killed with ether

That the effective 'blow' should be delivered whil the body descends through a distance fairly smal compared with a seems to be a reasonable assumptio on the basis of Richardson's work. Penney an Bickley's 'time' condition, that the stipulated chest wall velocity be acquired in 0 5 m.sec or less, shoul then be easily satisfied in the cases of the guinea pi and the mouse falling at 99 and 118 ft./sec. respectively For man, however, the position in this respec is more doubtful, at a rate of fall of 94 ft./sec the distance moved in 0 5 m.sec. is 1 5 cm, or onl 10 per cent of the value taken for a.

Some animal experiments were devised for testin the validity of these deductions. A vertical catapul was specially constructed for projecting guinea pigs belly first, into a large tank of water. Differen velocities were used, from 66 to 117 ft /sec Si animals were anæsthetized with ether, and four other were killed (as judged by respiratory arrest) som ten minutes before the experiment. Controls kille with ether showed no pulmonary pathology (Fig. 1) and lesions of only a trivial nature resulted fron projection into cotton wool at about 100 ft /sec.

Grave injury to the lungs, and other viscera, wa found in animals projected into water at velocitie greater than 104 ft./sec , both anæsthetized and dea specimens giving the same result. The effect wa diffuse pulmonary concussion, quite similar to tha of blast injury[1,3]. Confluent sub-pleural hæmorrhage were conspicuous (Fig 2), and in places presented linear pattern of 'rib markings'. Patches of sub pleural emphysema and occasional lacerations wer also found. Microscopically, there were structura changes throughout the lungs, the lower and middl

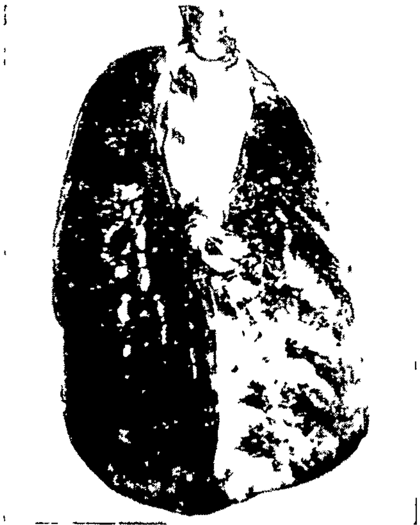

Fig 2 Lungs of a guinea pig projected into water at 107 ft /sec

obes being chiefly affected The predominant lesions vere hæmorrhagic consolidation, patchy atelectasis, nd traumatic emphysema amounting in places to avitation.

At slightly lower velocities, similar but more ocalized lesions occurred, and at less than 75 ft /sec he lungs were unaffected but for a few small subleural ecchymoses The living animals were all illed by the impact, even at the lower velocities, nd in no case was there evidence of death by rowning

These experiments, though few in number, indicate hat lung damage can result from impact with a vater surface at high incident velocities. The critical elocity for severe injury in the guinea pig would ppear to be consistent with the predicted value, ut the closeness of the agreement must be regarded s largely fortuitous in view of the approximate ature of the calculations

We are indebted to Squadron Leader P Howard, light Lieutenant D I Fryer and Mr. N. L Andrews or help and advice with the experimental work. ur thanks are also due to Sir William Penney for llowing us to quote from unpublished work, and to he Director-General of Medical Services, R A.F, for ermission to publish this communication

Crystalline-like Patterns in the Nuclei of Cells infected with an Animal Virus

A GROUP of viruses causing very peculiar changes f the infected cells in tissue cultures was recently solated in our laboratory[1]. The strains were obtained rom cases of either mesenteric lymphadenitis or haryngitis with cervical lymphadenitis. An apparntly identical microscopical picture[1] was caused by gents described by Neva and Enders[2] and Hilleman and Werner[3]. So far, all strains exhibiting this pattern of cytopathic activity which have been tested in our laboratory have had complement-fixing antigens in common, although by neutralization tests they could be differentiated into three types[1].

The ultra-structure of cells infected with one of our strains (*L O*.4574/54, isolated from a mesenteric lymph node) was studied by electron microscopy HeLa cells[4] were grown in stationary culture tubes on a piece of plastic placed at the bottom. This support for the cells was sliced from a piece of the plastic employed for embedding. Any toxic influence was removed by autoclaving in large amounts of distilled water. The specimens for sectioning were prepared by a modification of methods previously described[5] For fixation the pieces of plastic with their layer of cells were immersed in a 1 per cent solution of osmic acid (buffered at *p*H 7 2) for 30 min. at a temperature of 0° C They were then embedded in a methacrylate mixture The microtome devised by Sjostrand[6] was used for sectioning

Figs 1 and 2 reveal the picture within cells infected 48 hr earlier with the *L O.* strain A tissue culture

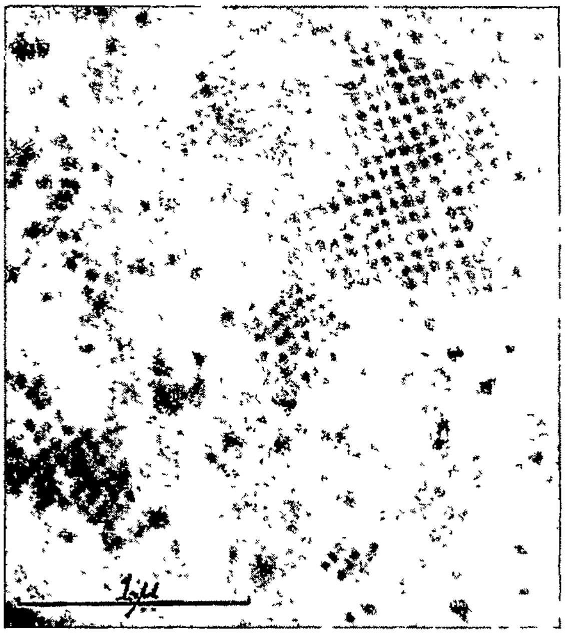

Fig 1

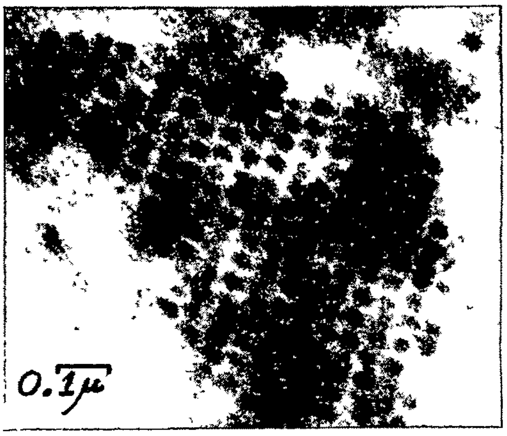

Fig 2

fluid filtered through a bacteria-retaining glass filter was used as inoculum in a dose corresponding approximately to $10^{5 \cdot 5}$ ID_{50} per 10^5 cells. Most nuclei in the sections of infected cultures contained crystalline-like patterns consisting of particles which usually appeared somewhat elongated and measured up to approximately 50 mμ × 30 mμ. These formations were seen more regularly and were often larger 48 hr. after infection than 24 hr. after infection. No similar patterns or particles were seen in sections of non-infected cultures or cultures infected with polio-myelitis virus type 1 (some of these experiments were carried out in co-operation with Dr. Aksel Birch-Andersen and Dr. Fritiof Sjöstrand)

In the preparations so far studied the cytoplasmic structure of cells with intranuclear 'crystals' appeared largely unchanged. This seemed to be in contrast to our findings in cells infected with poliomyelitis virus type 1 (strain *RC*), where cytoplasmic changes were obvious

Effect of Injections of Œstrogen on the Mast Cells of the White Mouse

There is no agreement on the connexion which may exist between mast cells and the function of endocrine glands It is known that the number of mast cells increases during hypothyroidism[1] and becomes normal in the hypothyroid subjects treated with thyroxin , it is also known that the number of mast cells in the rat and in the white mouse undergoes, under the influence of cortisone, a considerable increase, particularly in the interlobular connective tissue of the thymus, in the lymph nodes and in the bone-marrow[2]. A study of the behaviour of mast cells during other modifications of the endocrine equilibrium should thus be opportune.

Adult white mice, six males and six females, of a stock maintained in this laboratory for several years, were given daily injections of 100γ of dihydrofolliculine benzoate ('benzogynœstryl Roussel') , three animals of each sex were autopsied the day after the third injection and the three others of each sex were killed the day after the sixth injection Samples of tissues were fixed in Bouin's fluid, sectioned from paraffin and stained with polychrome blue, Mann–Dominici or cresyl violet–picrofuchsine

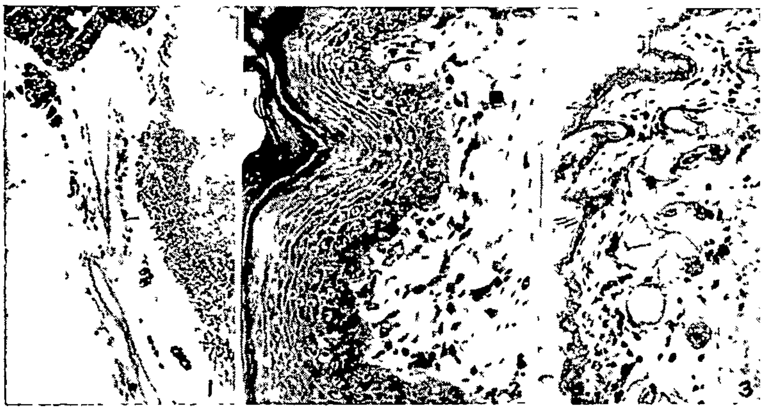

Fig 1 Salivary gland, top, at left , the cortex of lymph node to the right with connect ive tissue of excretory canal extremely rich in mast cells Bouin–Dominici

Fig 2 Vaginal epithelium with numerous mast cells in the dermis Bouin-polychrome blu

Fig 3 Subcutaneous connective tissue from the perineal region with a superabundanc of mast cells Bouin–cresyl violet–picrofuchsine

Examination of sections revealed a considerabl increase in the number of mast cells in all the organ studied . lymph nodes, thymus, visceral connectiv tissue (salivary glands (Fig. 1), intestine, genit organs (Fig 2)) and a very great increase in th subcutaneous tissue (Fig 3). The increase in numbe of mast cells and the influence of œstrogenic hormon is, as a rule, less in the male mouse than in the femal

This increase in the number of mast cells different from that described in the general syndrom of adaptation, either after injections of alloxan[3], c after irradiation with X-rays[4], because it is generalize and not limited to hæmopoietic organs. By it generalized effect, this increase in mast cells (labrc cytosis) recalls that of hypothyroidism

It is possible that a thyroid mechanism is implicate in determining the labrocytosis provoked by œstrc gens It is known that folliculin is an antagonist c thyroxin on certain hormone-sensitive organs, a for example, during the growth of the uterus in th ovariectomized mouse[5], or on the tubular segmer of the submaxillary gland of the mouse[6]. Th interpretation would explain the observation th labrocytosis is less marked in male mice treated wit œstrogen than in females

Effect of Growth Hormone on the Large Particle Content of Rat Liver

In the course of an investigation[1] of rat liver, wi respect to hormonal effects on the yield and cor position of fractions isolated by differential centi fugation in 0 25 *M* sucrose medium[2], determinatio have been made of the particle number in fresh isolated 'large-particle' ('mitochondrial') fraction

These fractions were obtained from liver homogenates, prepared with a Potter-type homogenizer and centrifuged at a low speed to remove 'debris' containing the nuclei, by further centrifugation for 20 min. in an 'Angle 13' (Measuring and Scientific Equipment, Ltd) centrifuge at 12,000 *g* (maximum value, at extreme tip of tube) The particles were suspended in 1 8 *M* sucrose solution and counted under dark-ground illumination as described by Allard *et al*[3] Under these conditions (in 1 8 *M* sucrose) the particle size-range is decreased (compressed), all visible particles up to and including the mitochondrial size-range were counted.

The study included hypophysectomized albino male rats of about 200 gm. weight, some of which had received daily injections of 0 3 mgm of pituitary growth hormone (presented by Armour and Co, Chicago) for eight to twelve days. The effect of adrenalectomy was also studied, with albino females of about 250 gm weight, given saline in place of drinking water The rats were arranged in groups, such that the experimental rats were compared with control rats (intact or sham-operated) which had been kept on the same food intake, and which were killed on the same day after an overnight fast

As shown in Table 1, there was a marked increase in 'large-particle number' with hypophysectomized rats given growth hormone. The absence of any significant change with untreated hypophysectomized or adrenalectomized rats suggests that there may be some pituitary hormone, other than adrenocorticotrophin, which has an influence converse to that of growth hormone on particle number. As reported elsewhere[1], hypophysectomy or adrenalectomy slightly diminishes the weight yield of the 'large-particle' fraction, and on administration of growth hormone to hypophysectomized rats the weight yield shows an increase which is, however, considerably smaller than the increase in number now reported.

Table 1 PARTICLE COUNTS ON 'LARGE-GRANULE' FRACTIONS ISOLATED FROM RAT LIVER

Hormonal status*	Particle number†, as per cent of that for control rats studied simultaneously (values calc as No /100 gm body-weight)
Hypophysectomized	123 ± 17 5 ($n = 5$)
Hypophysectomized + growth hormone	371 ± 25 7 ($n = 6$, $P \leqslant 0\ 1\%$)
Adrenalectomized	116 ± 39 0 ($n = 5$)

* Operated animals were killed two to three weeks after operation
† Mean ± stand error, *n* denotes number of observations, and *P* the probability that difference from controls could be due to chance

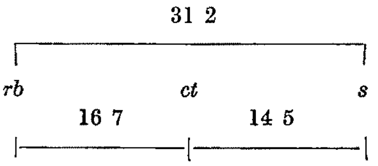
The Hypothesis of Chromosomal Interference

IT has been known for a long time that both chromatid and chromosomal interference produce similar effects on recombinations recovered in classical genetical (Mendelian) analysis in which single chromatids are sampled Although deviations from a unitary coincidence are probably due either to chromatid or chromosomal interference, the classical method does not permit one to determine whether one or the other, or both, processes are effective in producing the deviations It is strange, therefore, that chromosomal interference has been the accepted explanation of non-unitary coincidence since the very beginning of modern genetical analysis. The utility of either hypothesis in the analysis of single-chromatid experiments may be demonstrated by considering the following map



The expected frequency of double-recombinations would be 16 7 × 14 5 × 10^{-4}, or 2 4 per cent, whereas the actual frequency is only 0 9 per cent. The accepted conclusion has been that one cross-over actually interferes with the occurrence of another, the 'strength' of this interference being indicated by the coincidence value (in this case, 2 67) The hypothesis of chromatid interference is, however, equally applicable if one supposes that adjacent cross-overs form four-strand double exchanges at a frequency equal to or greater than 72 per cent.

Tetrad analysis provides an opportunity of discriminating between these two types of interference. The only positive data on this subject may be summarized as follows

(1) Negative chromosomal interference exists in *Neurospora*[1], that is, the presence of one cross-over 'facilitates' rather than inhibits the occurrence of another

(2) A mapping function which assumes a Poisson distribution of the number of cross-overs has produced additive distances in the otherwise non-additive recombination data in yeast, indicating that cross-overs occur independently of one another in these regions (C C. Lindegren and E E Shult, to be published)

It is clear from these findings that the existence of chromosomal interference has been neither demonstrated nor proved.

Crystalline Trypsin Inhibitors from the Indian Field Bean and the Double Bean

While studying the digestibilities of some Indian pulses, Gaitonde and Sohonie[1], from this laboratory, reported the detection of a trypsin inhibitor in field bean, *Dolichos lablab*. Since then, Sohonie and collaborators[2] have surveyed various Indian foodstuffs for the inhibitory factor and studied their properties in general. The field bean was found by them to be a fairly rich source of this principle and, as a continuation of their work, a simple method by which the trypsin inhibitor from field beans is obtained in a crystalline form is described here Kunitz[3], Bowman[4], Tauber and co-workers[5] have isolated similar crystalline preparations from different plant materials such as soybean, navy bean and lima bean respectively

1,000 gm of defatted field bean meal was extracted with 5,000 ml. of 0 25 *M* sulphuric acid at 25–28° C for 1 hr with occasional stirring The suspension was centrifuged and the residue rejected. The supernatant was saturated with magnesium sulphate and the precipitate separated This was taken up with 500 ml of 2 5 per cent trichloracetic acid and heated in a boiling water-bath for 5 min The suspension obtained was suddenly chilled in an ice-bath and filtered The filtrate was saturated for the second time with magnesium sulphate and centrifuged The residue was dissolved in 100 ml water and dialysed in a 'Cellophane' bag in a running stream of water. After about 20 hr, the contents of the bag, free from magnesium and sulphate ions, were centrifuged and the supernatant was precipitated by four volumes of cold acetone The acetone precipitate was separated by centrifugation and dissolved in a minimum quantity of water and lyophilized The yield was about 1 5 gm

This material has a light straw colour, is very easily soluble in water and shows a strong inhibitory action on trypsin. When to the aqueous solution 1 *M* sulphuric acid was added drop by drop until a faint turbidity appeared, and this was allowed to stand at room temperature, long needle-shaped crystals, visible under the microscope, were formed within a short time (Fig 1) This inhibitor gave a strong biuret reaction and was found to contain 13 6 per cent nitrogen

With the view of evaluating the potency of the preparation, the effect of different concentrations of it on trypsin was studied. Digestion tubes with various amounts of the field bean inhibitor and a constant quantity of the enzyme at 7·6 *p*H were kept for preliminary incubation for 10 min. at 37° C The skimmed milk substrate was then added and the tubes were further incubated for 10 min. The extent of inhibition was determined by Anson's[6] colorimetric method Proper controls were run simultaneously. The results are presented in Table 1.

Table 1 Effect of Field Bean Inhibitor on Trypsin (Merck)

Trypsin in each tube 5 mgm
Skimmed milk in each tube 150 mgm
Volume of the reaction mixture 5 ml

Concentration of the inhibitor (mgm)	Inhibition (per cent)
5	100
2 5	100
1 25	97
0 5	82

It will be seen that the field bean preparation exerts a strong inhibitory action on trypsin, as it almost completely inhibits four times its weight of the enzyme. Similar results obtained by Laskowski; Mars and Laskowski[7], Fraenkel-Conrat and others and Viswanatha and Liener[9] using crystalline trypsin with trypsin inhibitors from other sources show that the proportion of the inhibitor to trypsin for complete inhibition of the latter varies from 0 78 in the case of ovomucoid inhibitor to 2 65 in the case of Kazal pancreatic inhibitor. Whether the higher activity obtained for the field bean inhibitor as compared to that of the crystalline trypsin inhibitors mentioned is due to the fact that non-crystalline trypsin (Merck) was used in the present investigation is now being studied

Subjecting double bean (*Faba vulgaris*) flour to a similar treatment, a trypsin inhibitor was prepared by using ammonium sulphate instead of the magnesium salt An alternative method consisting of the extraction of the double bean meal directly with 2 5 per cent trichloracetic acid, heating the suspension and removal of the inhibitor in the filtrate subsequent dialysis, acetone, precipitation of the inhibitor from the supernatant followed by lyophilization, also gave a similar material The yield was 0 25 gm /100 gm. of the bean flour. Fine needle shaped crystals clustered together were obtained on treating this lyophilized powder in a similar manner with 1 *M* sulphuric acid (Fig 2) The double bean preparation is chalk-white, extremely soluble in water and shows a strong inhibitory action on trypsin, one part wa found to inhibit completely five parts of Merck trypsin powder The double bean inhibitor was remarkably heat-stable As much a 95 per cent of the inhibitory activity was retained even afte autoclaving at 15 lb for 30 min The preparation contained 12 pe cent nitrogen When tested qualitatively, it gave strong biuret and tryptophan reactions and a positive Molisch test

Further studies on the composition, physico-chemical properties, etc, are in progress and will b published elsewhere We are indebted to the Council of Scientifi and Industrial Research for finan

An Effect of Certain Proteins and Amines on Prostatic Acid Phosphatase

HIGH dilutions of seminal fluid in physiological saline often show markedly lower acid phosphatase activity than similar dilutions of the same specimen n serum or serum derivatives[1]. This difference is especially marked in specimens which have been stored for some days or weeks in the refrigerator Similar differences may be found between the acid phosphatase activity of saline extracts of human prostate diluted with saline and those diluted with erum derivatives

It was found that by the addition of gelatine it is possible to maintain phosphatase activity in saline-diluted seminal fluid as effectively as in the presence of serum. Fig 1 shows the curve of acid phosphatase activity of highly diluted seminal fluid in samples containing different concentrations of gelatine Results are expressed as a percentage of the activity obtained in the presence of 50 mgm gelatine/100 ml

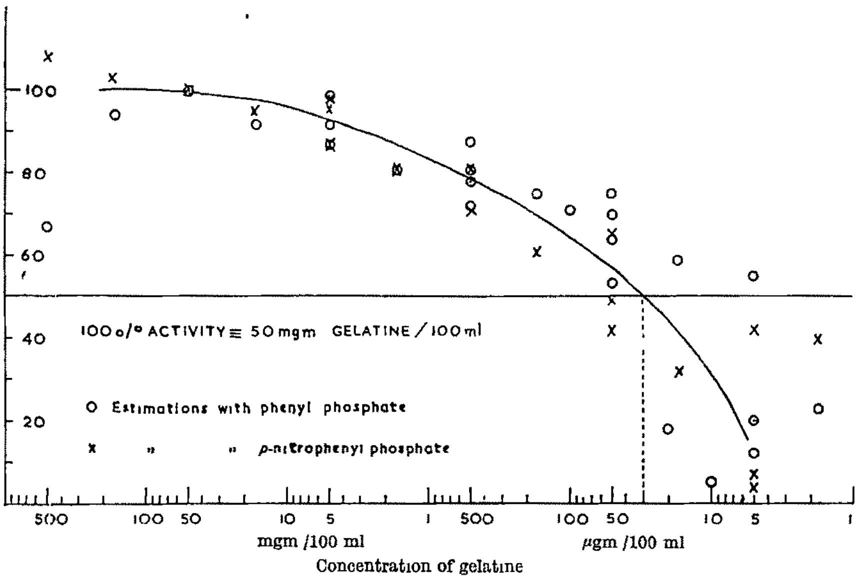

Fig 1

The specimens which were used for these experiments showed in complete absence of gelatine less than 20 per cent, and usually less than 10 per cent, activity At a concentration of approximately 30 μgm gelatine/100 ml the activity was about half that obtained in the presence of 50 mgm gelatine/100 ml.

The concentration of any substance required to give half the activity shown by a sample containing 50 mgm gelatine/100 ml in any given preparation of prostatic phosphatase was taken as a constant of activity, *A*, for the comparison of different substances *A* expressed in μgm /100 ml. was 30 for gelatine, 50 for blood albumin, 21 for salmine sulphate and 20 for clupein sulphate A similar effect was found with a number of amino-compounds, but far greater concentrations were required for comparable activity The values of *A* for some of these substances, expressed in millimoles/litre, were as follows ethylamine, 143, ethylene diamine, 7, trimethylene diamine, 11, tetramethylene diamine, 6 7, pentamethylene diamine, 4 5, hexamethylene diamine, 0 19, spermidine (NH_2 $(CH_2)_3$ NH $(CH_2)_4$ NH_2), 0 15, decamethylene diamine, 0 08, spermine (NH_2 $(CH_2)_3$ NH $(CH_2)_4$ NH $(CH_2)_3$ NH_2), 0 03, and 'Synthalin *A*' (NH_2 (NH)C NH (CH_2)10 NH C(NH) NH_2), 0 015

The effect is seen to increase with the chain-length between terminal amino-groups. It is not decreased by the formation of benzyl or dinitrophenyl derivatives, but is completely destroyed by acetylation Amides and α-amino-acid groupings are inactive malonamide is completely inactive up to a concentration of *M*/10, whereas trimethylene diamine shows half activity (*A*) at *M*/90, histidine and tryptophan are both inactive (at *M*/10 and *M*/100, respectively), but histamine and tryptamine each have a value of *A* of about *M*/200 Arginine has a slight effect, with a value of *A* about *M*/17, but this can be attributed entirely to the guanidino group, as the value of *A* for guanidine is about *M*/20 Ornithine also shows a slight effect, but less than that of ethylamine, none was found for lysine, asparagine, citrulline, serine or glycine, up to a concentration of *M*/10

The action of gelatine is not significantly reduced by peptic digestion, but is very markedly reduced by digestion with trypsin or papain (the digestive enzyme was inactivated by boiling carried out before the test), and is completely destroyed by hydrolysis with 8 *N* hydrochloric acid This supports the hypothesis that the effect of proteins and peptides is related to the amino-groups of basic side-chains, linked through the peptide chain to produce an effect similar to that of the long-chain polyamines

The effect described appears to be due to a protective action of these substances which prevents inactivation of the enzyme on extreme dilution, since addition of gelatine after the start of incubation fails to restore acid phosphatase activity This destruction or denaturation of the enzyme would appear to be an immediate outcome of the final dilution in the substrate mixture, due perhaps to surface denaturation by the glass tubes, as suggested by London and Hudson[2] Curves for enzyme activity are linear, both in the presence of protective substances as well as in their absence when activity is at the minimum

I thank the British Empire Cancer Campaign for the grant which supported this work, and Evans Medical Supplies, Ltd, for the gift of 'Synthalin A'

Detection of Vascular Tissues available for Water Transport in the Hop by Colourless Derivatives of Basic Dyes

In the course of a study of the host–parasite relations in *Verticillium* wilt of the hop, it has been observed that infection of the vascular system by the pathogen is frequently accompanied by the development of numerous tyloses, and that a considerable proportion of the vascular elements in a diseased plant may thus be rendered useless for the passage of water

The extent of such obstruction in the vascular cylinder as a whole is not readily determined by examination of transverse sections, for the absence of tyloses in certain vessels in the plane of the section does not preclude the possibility that they may be present in those same vessels at levels above or below that of the section. A more satisfactory method is to allow the plant to take up an aqueous solution of a dye which will stain permanently any vessels through which it passes Sections prepared afterwards will then give a clear indication of the parts of the wood available for water transport

A number of stains at a concentration of 0 1 per cent in water were introduced into hop plants by petiole injection following the methods of Roach[1], and also by severing the stem at soil-level and inserting the cut end in a tube of the solution It was found that acidic dyes, for example acid fuchsin, light green and eosin, travelled freely in the plant but diffused from the vascular elements into neighbouring tissues and in subsequent processing were more or less completely removed from the vessel walls

Basic dyes such as malachite green, methylene blue, safranin, crystal violet and basic fuchsin stained lignified tissues deeply but were far less mobile than the acidic types Basic fuchsin or crystal violet applied by petiole injection travelled only a few millimetres from the point of application and induced wilting Thus none of the stains tested was suitable for the purpose, although it should be noted that in some other species, for example tomato, basic fuchsin was found to travel slowly but extensively, and little wilting occurred until the plant had become fairly generally injected

Satisfactory results with hop plants were finally achieved by the use of colourless forms of basic fuchsin and crystal violet derived by treatment of the dyes with sodium metabisulphite 10 per cent aqueous sodium metabisulphite was added slowly an with vigorous shaking to 100 ml of 0 1 per cen solution of basic fuchsin or crystal violet in wate (B D H. Standard Stains) until the dye was almos completely decolorized This required approximately 5 0 ml. of metabisulphite for basic fuchsi and 10 0 ml for crystal violet A faint residu colour appeared to have no undesirable effect, an a considerable volume of metabisulphite solution wa required to remove it entirely

Application of such solutions through the base c the stem or by petiole injection led to intense staining of the vascular elements in the immediat vicinity within 1–3 mm, and the stain was transported throughout the vascular system of a health plant at a rate comparable with that of the mobil acidic dyes

Sections cut from the stained material wer counter-stained with 1 per cent light green in 95 pe cent ethanol and dehydrated for preparation c permanent mounts without loss of stain from th vessel walls

Short segments of the stem were treated with hc 15 per cent nitric acid for 5–15 sec to remove ep dermal and cortical tissues, dehydrated in ethan and cleared in clove oil for preservation as permaner whole-mounts

The basic fuchsin derivative appears to be relativel non-toxic, and it is possible that it might be used i growth studies for 'marking' vascular tissues *in situ* i growing plants The method may also be useful i anatomical studies of, for example, the structure c the nodal regions of shoots

Role of Sulphydryl Groups in the Long-range Elasticity of Wool

Fibres of wool and hair may be stretched nearl 100 per cent in water at room temperature, and the return to their original lengths on being release If a fibre is stretched more than about 30 per cen or if stretched very slowly to any extension and the released, subsequent stretching requires less energ indicating that an irreversible change has taken place In explanation of these effects it has been postulate that hydrolysis of disulphide bonds occurs durin stretching to give sulphydryl and sulphenic-aci groups, but direct evidence for the production c either of these in wool or hair is lacking[2,3].

A sensitive colorimetric method for estimatin sulphydryl groups in wool, based on that of Va Scott and Flesch[4], has now been developed, and fu details of the method and results will be reported els where Tests on samples of merino wool before an after stretching to about 60 per cent in water a room temperature have not revealed any increase i the number of sulphydryl groups on stretching, thu suggesting that hydrolysis does not play a large pa in the stretching of wool under these conditions. A alternative explanation, based on the fact that wo fibres contain small amounts of free sulphydr groups[5] and that they are difficult to stretch in aci solution[3], is as follows

If, during the stretching of a wool fibre, a sulphydryl group comes into contact with a disulphide bond, reduction may occur with the formation of a new sulphydryl group and a new disulphide bond

$$R^1{-}CH_2{-}SH + R^2{-}CH_2{-}SS{-}CH_2{-}R^3 = R^2{-}CH_2{-}SH + R^1{-}CH_2{-}SS{-}CH_2{-}R^3$$

$$\text{or} = R^3{-}CH_2{-}SH + R^1{-}CH_2{-}SS{-}CH_2{-}R^2,$$

where *R* is part of a polypeptide chain. Since the ibre is under tension, the new disulphide bonds will end to be such that they do not oppose stretching, o that in a stretched fibre some of the disulphide bonds will have been rearranged, with the elimination of those that opposed stretching Unless these are re-ormed during contraction, subsequent extensions of he fibre after release will be easier, although the number of disulphide bonds and sulphydryl groups will be unchanged Sulphydryl–disulphide interchanges in solution have been reported for simple peptides[6], ovalbumin[7] and bovine plasma albumin[8]

According to the above mechanism, wool fibres with no free sulphydryl groups should be more difficult to stretch than usual Fig 1 shows part of the elongation of three groups of merino fibres—purified oot ends from one staple of wool *E6N*—under a oad of 6 × 10⁵ gm per cm.[2] cross-section at 25° neasured by the direct loading method[9]. Fibres of group *A* were treated for four days with a 0 05 *M* olution of N-ethylmaleimide in *p*H 7 4 phosphate buffer to block sulphydryl groups , those of group *B* were treated for the same time with the buffer solution only , while those of group *C* were untreated Fibres of group *A* and group *B* were stretched in water and those of group *C* in 0 1 *N* hydrochloric acid There is little difference during the initial rapid xtension to about 37 per cent , but beyond this, he fibres of group *A*, which had been treated with N-ethylmaleimide, stretched at a much slower rate han those of group *B*, which had not been treated with this reagent, and, in fact, were almost as slow as the fibres stretched in acid (group *C*) Similar esults were obtained if iodoacetamide or mercuric chloride were used in place of N-ethylmaleimide. With he possible exception of mercuric chloride, these eagents should not be able to form new cross-links in the fibres, so the slower rates of stretching are presumably due to inhibition of sulphydryl–disulphide interactions.

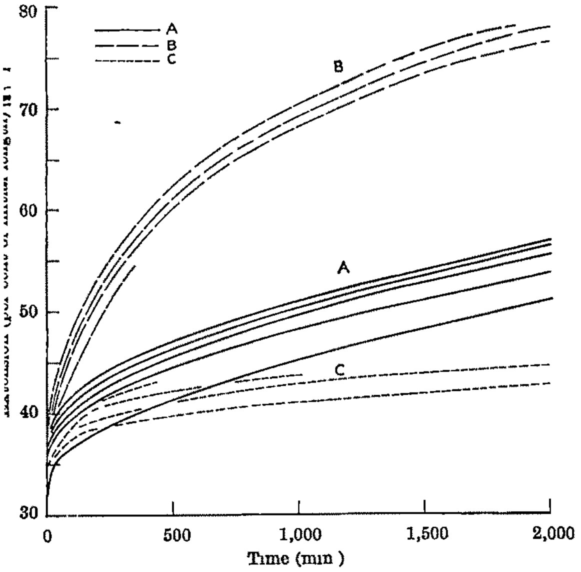

Fig 1

It is possible that this process has a wider application in wool chemistry For example, it appears to play some part in supercontraction by means of phenol The supercontraction of merino fibres (from sample *E9N*) after boiling for 10 min in 50 per cent aqueous phenol[10] was found to be 11 3 per cent (average of values for eight fibres, coefficient of variation 24 2 per cent, probable error 1 0) for fibres that had been pretreated for two days with 0 1 *M* iodoacetamide at *p*H 8 , as compared with 25 5 per cent (seven fibres, coefficient of variation 11 3 per cent, probable error 1 2) for untreated fibres from the same staple.

I am indebted to Dr P C Carman for his advice and criticism, to the South African Wool Board for sponsoring this work, and to the South African Council for Scientific and Industrial Research for permission to publish this report

Molecular-sieving Properties of Starch

Molecular-sieving by porous adsorbents and carriers generally used in column chromatography is a potential analytical method[1] Comparatively little, however, is known about their working-ranges in molecular-weight separation, that is, the pore diameters of the different substances In connexion with zone-electrophoretic examination of cheese extracts on a starch column, a very distinct molecular-sieve effect was incidentally observed. In order to investigate to what extent this effect could be used for determining the molecular-weight distribution among the peptides of the sample, a solution of the cheese in citrate buffer *p*H 6 7 (21 gm citric acid monohydrate + 290 c c *N* sodium hydroxide to a volume of 1 litre) and a mixture of amino-acids dissolved in the same buffer were 'chromatographed'. The dimensions of the starch column were 2 cm × 120 cm 275 fractions of 1 ml were collected from about 75 mgm of applied substance at a rate of 4 ml /hr The elution curves obtained showed that the substance was separated into two peaks, one of which had the same position as the amino-acid peak (Fig 1), whether it was obtained from the synthetic mixture or prepared from the cheese[2]. Chromatographic and electrophoretic examination of certain fractions of these peaks confirmed the identity between the latter and the amino-acids

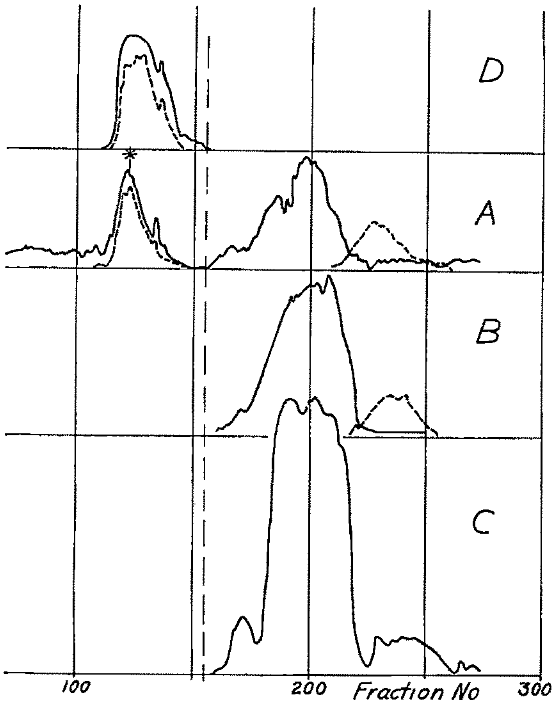

Fig 1 Molecular-sieving on starch column of cheese extracts dissolved in citrate buffer *p*H 6 7 Solid lines represent ninhydrin reaction, broken lines phosphorus content Peaks to the left of the vertical broken line (fraction 155) represent material which cannot enter the starch grains Peaks to the right of the line represent material which can freely enter the water present in the starch grains
A, Total cheese extract The asterisk * shows the fraction containing the peptide of relatively low molecular weight (see text) *B*, Amino-acids of the same extract obtained by ethanol precipitation of peptides *C*, Mixture of amino-acids in the same proportions as those in which they are to be found in casein *D*, High-molecular peptides obtained from cheese extract by dialysis

Further experiments with cheese extract dialysed in 'Cellophane' for 36 hr against tap water showed that the first peak corresponded approximately to the material which did not diffuse (molecular weight greater than 13,000[3]) In the first peak, however, there could be shown chromatographically, at the point marked * in curve *A*. a peptide forming a distinct round spot on the chromatogram This indicates that the molecular weight of this peptide cannot be very high[4]. From this we conclude that starch acts as a molecular sieve with a separation range between the molecular weights of the amino-acids (75–200) and those of the peptides which can still be chromatographed (maximum about 500) There are obviously possibilities for analytical work in this field, and it also seems that it may be possible to isolate amino-acids preparatively from mixtures of peptides using a starch column

Ion-Exchange Separations on Chemically Modified Cellulose

IN a study of methods for flame-proofing cotto fabrics, Dr J D Guthrie *et al* , of the U S Depart ment of Agriculture, have prepared a number o chemically modified cellulose fabrics and hav described[1] their ion-exchange properties The sam workers have modified the *p*H of sample solution obtained during the preparation of protein from o seed[2] by addition of phosphorylated and aminate cotton fabrics While suitable for this type o operation, the modified cellulose in fabric form is no a convenient material on which to carry out chromato graphic separations, and the possibility of convertin the fabric to pulp and then to paper has been ex plored Using aminated and phosphorylated cotto fabrics as starting materials, experimental sheets o paper have been prepared by W and R Balston Ltd , which have since been examined at the Chemica Research Laboratory The preparation of sheets o paper with suitable chromatographic properties still in the experimental stage, but the separatio of a number of inorganic mixtures has been achieve with the materials so far available

Separations of cationic mixtures were carried ou on strips of phosphorylated paper prepared fro cotton fabric which had been treated with ure phosphate This material had a phosphorus conten of 3 85 per cent and a capacity of 2 04 milliequiv per gm , which is in approximate agreement with th findings of other workers[3] that the phosphate grou is singly bound to the cellulose, leaving two hydroge atoms available for exchange Separations wer carried out on strips of paper 1 cm in width and 20 cm long A solution of mixed metal salts in dilute aci was placed near one end of a paper strip which wa allowed to dry in the atmosphere The strength o the test solution was adjusted so that the quantit of metals placed on the paper did not exceed th capacity of the area of paper covered by the drie sample spot Chromatographic development wa achieved by the upward diffusion of various aqueou salt and mineral acid solutions The position of th separated metals was then found by spraying th strip with suitable reagents

An excellent separation of iron, copper and nick was obtained using 2 *N* sodium chloride as th developing solvent When a solution containin 50 μgm of each metal was placed on the strip, ver sharp narrow bands of each metal were obtaine (Fig 1*a*) having the following R_F values . ferric iro 0 0 , copper, 0 3 , and nickel, 0 5 With the sam developing solution, aluminium and beryllium re mained with the iron, while cobalt and lead had *R* values of 0 4 and 0 5 respectively In further exper ments the quantity of metals placed on the pape strip was increased sufficiently to be in excess of th ion-exchange capacity of the area of paper covere by the test spot This resulted in wider bands, bu it was still possible to separate 0 5 mgm quantitie each of iron, copper and nickel on strips of 20 cm length (Fig 1*b*)

The separation of anionic mixtures was attempte on sheets of paper prepared from cotton fabrics whic had been treated with 2-amino-ethyl sulphuric aci Modified cellulose of this type was found to hav strong water-repellent properties, and more difficult was experienced in preparing paper suitable fo chromatographic purposes than was the case wit phosphorylated cellulose In spite of the very poo

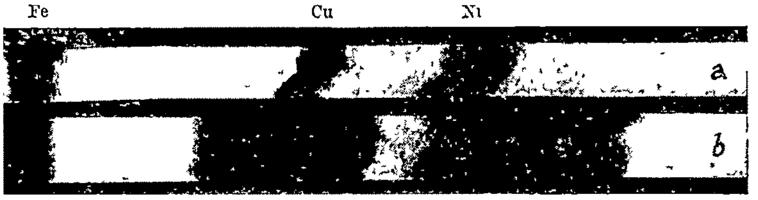

Fig 1

id uneven wetting properties of the sheets of paper ailable, it was possible to obtain a partial separation gold, platinum, palladium and rhodium as their doro acids A solution of $2N$ hydrochloric acid as used as developing solvent, and R_F values of 2 for gold, 0 3 for platinum, 0 4 for palladium and 6 for rhodium were obtained , but the bands were ffuse and slightly overlapping. Further work is in ogress aiming at producing more suitable sheets paper.

Separation of cation mixtures was also achieved columns of phosphorylated paper pulp In these periments, columns (6 cm × 1 cm) were prepared om a mixture of phosphorylated pulp blended with itreated cellulose pulp These were washed with lute hydrochloric acid to convert the pulp to the drogen form and then with a mixture of $2N$ sodium doride and $N/10$ sodium carbonate to convert to e sodium form A mixture containing 5 mgm ch of ferric iron, copper and nickel was lsorbed on to the top of each column, which was en eluted with an aqueous salt or acid solutions ith $N/2$ hydrochloric acid, copper and nickel were uted rapidly with 25 ml of acid, leaving the iron the top of the column Using molar calcium doride, nickel was eluted in the first 25 ml of solution, followed by copper in the next 50 ml of solution, hile iron was found firmly retained at the top of e column. To remove the iron it was found necesry to use a complexing agent such as acetone conining hydrochloric acid, which rapidly eluted the on and left the column in the hydrogen form ready r re-use

A Chromatographic Separation of *Meta*- and *Para*-Cresols

The separation of isomers has always been a major oblem in analytical chemistry. In the case of *meta*- id *para*-cresols, this difficulty is a very real one, for the absence of spectroscopic apparatus there is no ailable method for determining both these comonents

In this laboratory the application of partition iromatography for this purpose has been investiited, and the work has led to the complete separaon of the two isomers

In the method developed, the column is 1 cm in ternal diameter and has a packed length of 45 cm The packing is 13 gm of 'Celite 535' to which 5 ml. of the stationary phase has been added, the latter being a 0 5 M phosphate buffer of *p*H 11 5 Commercial *cyclo*hexane is the mobile phase, which is forced through the column by pressure from a nitrogen cylinder at 0 8 ml per min.

The cresols are placed on the column in a solution which is $M/100$ with respect to each component The progress of the chromatogram is followed by a spot test which is given by 2 chloro 4 nitrobenzene diazonium naphthalene 2 sulphonate A drop of the eluate is mixed with a drop of an aqueous solution of the reagent , to this is added a drop of 2 per cent sodium hydroxide, and, if any cresol is present, a red colour develops. This spot test will readily detect 5 parts per million of cresols

The eluate is collected in 2-ml fractions and analysed colorimetrically using the reagent mentioned above The results of this work are shown in Table 1. *Ortho*-cresol is included to show that all the isomers are separated, although the separation of *ortho*-cresol from the other two isomers is not particularly difficult

Table 1

	Position of peak	Total fraction containing the isomer	Weight of isomer taken (mgm)
Ortho cresol	36 5	35–40	0 1
Para cresol	59 0	56–69	0 3
Meta-cresol	77 0	72–87	0 1

The platage of the column has been calculated using the second method of James and Martin[1]. The volume which would have contained the two midstandard deviations is obtained by plotting the cumulative fraction percentages on logarithmic probability paper. This gave a theoretical plate-height of 0 45 mm.

The work has been only of a qualitative nature so far , but it is hoped to use this separation as the basis for a quantitative method of estimation of the three isomeric cresols

Potassium Permanganate in the Kjeldahl Method for the Determination of Nitrogen in Organic Substances

An investigation into the mode of occurrence of nitrogen in coals necessitated devising a suitable method for its determination The ordinary macro-Kjeldahl method was much improved in speed and reliability by using a mixed selenium–mercury catalyst with the usual potassium sulphate , but even in this case some doubt always existed as to when the conversion of all the combined nitrogen of the substances into ammonia was complete, and whether there might be loss of ammonia during the digestion, which was indeed observed when the temperature was greater than 370° C.

Quite recently, a rapid and reliable semi-micro method that uses an oxidizing agent—potassium permanganate—instead of the usual catalysts (oxygen carriers) has been described by me[1], and still more recently this has been applied to the micro-scale In the semi-micro method 1–2 mgm , and in the micro-method 0 2–1 mgm., of nitrogen are determined, digestion being conducted with 10 ml and 2 ml of sulphuric acid respectively, in 8 in × 1 in glass boiling-tubes each heated by a controllable micro-burner A preliminary digestion of about five minutes is given, and after slight cooling, potassium permanganate is added in successive small amounts with shaking until the digest becomes char-free After boiling for one minute and cooling somewhat, sufficient permanganate is added to produce a dirty sage-green coloration Digestion for a further minute completes the conversion The ammonia is determined by steam distillation from the alkalinated digest, the condenser tube being of clear silica instead of glass to avoid the pick-up of alkali, and the receiver contains 1–2 ml of a three-quarters saturated solution of boric acid Distillation is complete in six minutes, and the condensate is titrated with centinormal hydrochloric acid using methyl red–methylene blue indicator

Digestion occupies about twelve minutes, cooling about five, and the distillation and allied operations take about ten minutes, so that an individual determination can be performed in about 30 min , though it is easily possible unaided to do about thirty-six determinations per working day

Using permanganate, an investigation has shown that about 90 per cent of the nitrogen of coals has been converted at the char-free stage, the remaining 10 per cent being converted by the final permanganate addition and the short after-boiling With resistant non-charring substances, all the conversion occurs during the last period It has been found, contrary to expectation using such a powerful oxidant as potassium permanganate, that no loss of nitrogen (or ammonia) occurs at any stage of the digestion, not even when, subsequent to completion, the acid digest is boiled for two hours with excess permanganate The temperature, however, should not rise above 330°.

On the semi-micro scale coals, cereals, feeding stuffs, leather and various alkaloids of low nitrogen content have been satisfactorily tested, while the same success, using micro-amounts, has been achieved with pyridine carboxylic acids, tryptophan, and all the alkaloids so far examined

Both methods have been favourably reported upon by independent workers and can, it is believed, fairly be claimed as the most nearly perfect Kjeldahl method so far devised A considerable degree of uncertainty has existed in values obtained by earlier methods where the rate of heating, type and amount of catalyst, temperature and duration of digestion may all have adverse effects on the values obtained

The micro-method, with details of the investigations leading to its evolution, will shortly be published

Solubility of Silica

In 1932, Kettle published experimental result which suggested that the fibrogenic activity of silic in silicosis is due to silicic acid formed when th inhaled dust dissolves in tissue fluids Since tha time, the dissolution of silica and mineral silicate in water and physiological fluids has been widel studied in laboratories concerned with pneumoconiosi research

When powdered silica is added to water, the con centration of dissolved silicic acid increases rapidl at first but afterwards much more slowly "All size of quartz particles behaved as if a soluble fractio of silica was being leached from their surfaces, leavin a relatively insoluble residue, or core, which seem to be resistant to the dissolving action of wate The amount of leachable silica which can be dissolve from the particles is greater with the samples c small size quartz than with those of larger size"

The phase of rapid solution has been variousl attributed to trace impurities in the silica[2], to rapi solution from sharp edges and corners[3] and to thick disorganized layer[4] analogous to the Beilb layer on metals The layer was estimated to b 200–1500 A thick Heavens[5] was unable to fin evidence for a thick amorphous layer on a quart crystal by electron diffraction methods

We have evidence that the anomalous solubilit characteristics of silica are due to an incomplet monolayer of adsorbed silicic acid on the silica surfac The evidence for this layer is as follows

(1) When silica is extracted with alkali, the curv corresponding to the slow reaction shows a linea concentration–time relationship Extrapolation c the curve until it cuts the axis at zero time indicate the amount of silica which dissolves rapidly As monolayer, this amount (0 13 mgm /gm on a powde of surface area 1 m ^{2}/gm) would extend over 0 16 c the surface

(2) Powder which has been treated in this way wit alkali will rapidly adsorb from a silicic acid solutio an amount of silicic acid equivalent to that rapidl removed by alkali

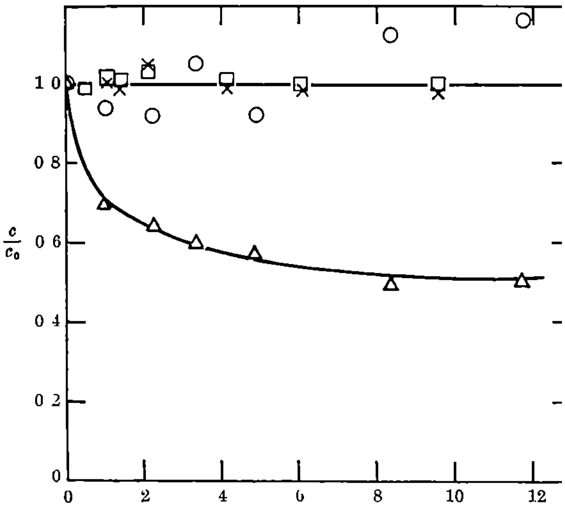

Fig 1 Alteration in the concentration of ^{31}Si-silicic acid at pH 5 (△) and pH 9 (□) and total silicic acid at pH 5 (○) and pH 9 (×) on adding a silica powder to a silicic acid solution The change in the concentration of the solute is denoted as the ratio of the concentration (c) after a measured time to the initial concentration (c_0)

(3) Silica in the layer, but not silica in the lattice, ill exchange in alkaline but not in acid solutions ith silicate solution labelled with silicon-31 When silica powder is added to a 'saturated' ^{31}Si–silicic cid solution at *p*H 5, neither the total concentration f the silicic acid nor the concentration of the labelled licic acid in the solution is changed (see Fig 1) f the experiment is carried out at *p*H 9, the total oncentration of the silicic acid is still unaltered, but e concentration of the labelled silicic acid is reduced, dicating that exchange has occurred between the issolved silicic acid and the silicic acid that is dsorbed on the silica surface

If it is assumed that the extent of the surface-yer of adsorbed silicic acid does not vary, the eight of adsorbed silicic acid in a unit weight of owder can be calculated when the surface area is nown On considering the data from several labratories, we find that the amount of silicic acid we redict to be on the surface is in most cases identical ith that which was observed to dissolve rapidly ccording to the published figures

It is evident that the widely varying 'solubility' alues previously reported for quartz represent ainly the mass of the adsorbed layer The reported ependence of the solubility on the mass of solid xtracted and on the particle size can now be xplained

A detailed account of this work will appear in the *ournal of the Chemical Society* We are indebted to he British Steel Castings Research Association for nancial assistance

Rheological Properties of Coal during Carbonization

The work on viscosity changes in coal during rbonization first reported in *Nature*[1] has been xtended to include other rheological properties of oal, in particular its instantaneous and retarded lasticities

Coal was subjected to sudden application and emoval of stress during constant-temperature caronization in a modified Gieseler apparatus (as escribed in ref 1) and the strain-retardation and ress-relaxation phenomena were observed It was und that the mechanical properties of the coal can e represented by a spring-dashpot model The mplest model consistent with the observed pheomena is a Maxwell model in series with a Voigt–elvin model as shown in Fig 1, where two springs f stiffness G_1 and G_2 represent the elastic behaviour f the material, while two dashpots of resistance $_1$ and η_2 represent the flow viscosity and the internal iscosity respectively The relaxation-time (that is, e time in which an applied stress decays by a ctor $1/e$) is $\tau_1 = \eta_1/G_1$, while the retardation-time he time in which a strain reaches $1/e$ of its final alue on stress change) is $\tau_2 = \eta_2/G_2$

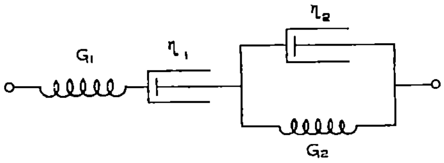

Fig 1

The modified Gieseler apparatus was used as follows The sample is raised at 3 deg C per min to a temperature within the plastic zone, and is then kept at the temperature reached A stress is applied and then removed when conditions are steady The rate of change of strain before removal gives η_1, and the strain observations after removal, which are made at 5-sec intervals for 1 min, give the values of G_1, G_2 and η_2 when extrapolated to zero and infinite time (Separate experiments showed that the extrapolation to infinite time according to an exponential law is justified) Thus, in a period of about two minutes, one set of values of the four parameters is obtained These values are assumed to remain sensibly unchanged during this short period Then change in the course of the carbonization is shown in Table 1 The values refer to a typical good South Wales coking blend (coal rank code number 301, 24 6 per cent dry ash-free volatile matter), carbonizing at 438° C The figures refer to a single carbonization, but are typical

Table 1

Parameter	Minimum value	Rises according to*
η_1	7×10^4 poises	6×10^4 exp 0 14*t*
G_1	30 to 40×10^6 dynes/cm ^{2}	40×10^6 exp 0 07 (*t*--10)†
$\tau_1 (= \eta_1/G_1)$	about 0 002 sec ‡	0 003 exp 0 07*t*
η_2	130×10^6 poises	130×10^6 exp 0 07*t*
G_2	7×10^6 dynes/cm ^{2}	7×10^6 exp 0 07 (*t*−5)†
$\tau_2 (= \eta_2/G_2)$	about 15 sec	constant at 25–30 sec

* *t* in minutes Zero time is taken at the minimum viscosity value

† The exponential rise begins later as the elasticity minima are less sharply defined than those of the viscosities

‡ The low values of τ_1 were confirmed qualitatively by direct stress relaxation measurements at constant strain

In order to test the adequacy of the model, a briquette of a Barnsley Seam coal (coal rank code number 601, 36 7 per cent dry ash-free volatile matter) was compressed during carbonization in a specially designed apparatus Allowing for the continuous contraction of the briquette (on account of loss of volatile matter) which was superimposed on the strain, the stress–strain–time relationship was found to correspond exactly to that expected from the model (see Fig 2)

By the help of the model it was possible to make allowance for the slight viscous flow in a briquette at carbonizing temperatures and to treat the briquette as a body having purely elastic properties The value of Young's modulus at these higher temperatures could then be measured (using the special apparatus mentioned above) The results show that Young's modulus increases steadily in rising-temperature carbonization, with a dip in the region of about 550°–600° C. The modulus rises to about 5×10^9 dynes/cm ^{2}, which is the highest value the apparatus will distinguish from absolute rigidity The activation energy for this process can be calculated from the temperature coefficient of the rate of rise of elasticity with time at constant temperature A value of 50 ± 8 k cal per mole was found

It is of interest to compare this latter value with that of $52 7 \pm 2 8$ k cal per mole reported earlier[1]

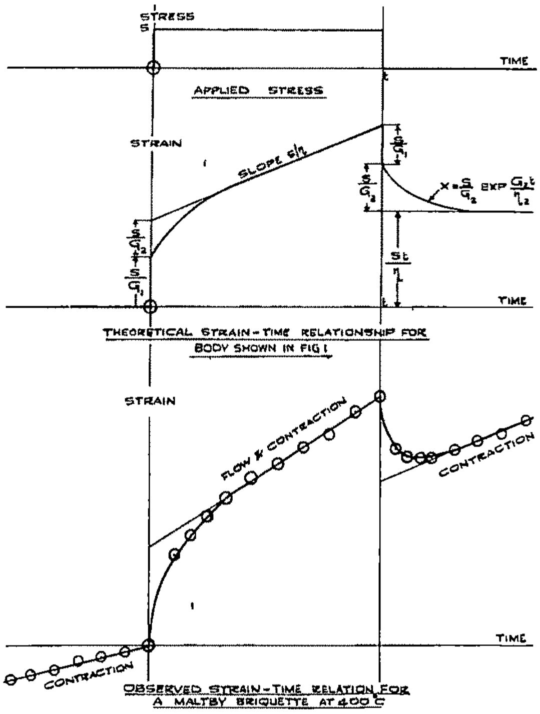

Fig. 2

for the activation energy for the decomposition reaction within the plastic zone, determined from the rate of rise of viscosity with time at constant temperature It is possible that increase both of viscosity and elasticity are aspects of the same fundamental process leading from a relatively mobile fluid to an elastic solid, and that the chemical changes taking place are of constant nature throughout

Conductivity induced in Unplasticized 'Perspex' by X-rays

The conductivity induced in unplasticized 'Perspex' (polymethylmethacrylate) by X-rays differs markedly from that induced in ordinary plasticized 'Perspex' First, the time-constant of recovery after irradiation is very long (several hours) for the unplasticized material, whereas for ordinary 'Perspex' it is much shorter[1] Secondly, the equilibrium induced current i_x is related to the dose-rate R by the general formula

$$i_x \propto R^{\Delta} \qquad (1)$$

where $\Delta = 0\ 55 \pm 0\ 05$ for unplasticized 'Perspex', but Δ is nearly unity for plasticized 'Perspex' These properties place unplasticized Perspex' in the same class of behaviour as polyethylene[1,2], polytetrafluorothene[3], and polystyrene[4,5]

The range of dose-rates was 2–64 r./min, and the range of temperature 20°–80° C for plasticized, and 20°–100° C for unplasticized 'Perspex' Th measurements were made, as previously described[1] using a d c amplifier to measure the curren in a specimen placed in a chamber which coul be evacuated The X-rays were generated a 220 kVp, with a half-value layer of 1 7 mm o copper

Dependence on temperature Fig. 1 shows the graph of log (conductivity) of unplasticized 'Perspex plotted against the reciprocal of absolute temperature The resulting straight lines are of slope proportiona to the activation energy W according to the genera formula.

$$\sigma = \sigma_0 \exp(-W/kT) \qquad (2$$

In the case of static conductivity (no inciden radiation; Fig 1*a*) $W = 1\ 6$ eV, rather greater tha for some of the other materials we have measure (polythene 1 5 eV, polytetrafluoroethylene 1 1 eV polystyrene 1 2 eV) This is consistent with the lov value of static conductivity itself observed i unplasticized 'Perspex'

For the equilibrium induced conductivity unde X-irradiation (Fig 1*b*) at $R = 7$ r/min, the slop corresponds to $W_x = 0\ 5$ eV This value of W_x i substantially the same as in the other materia mentioned, making it appear that the process o induced conductivity is fundamentally the same i all of them. The actual values of induced conductivity for unplasticized 'Perspex' are comparatively low, and similar to the values for plasticize 'Perspex'

The variations of induced current with temperatur shown in Fig 1 are consistent with the model o an exponential distribution of traps in depth, base on the theory of photoconducting insulators[6] tha we have used previously Between 20° and 80° C the induced current is observed to increase by factor of 20, whereas theory predicts a factor of when Δ = 0·55 The agreement is not unreasonabl for this type of experiment

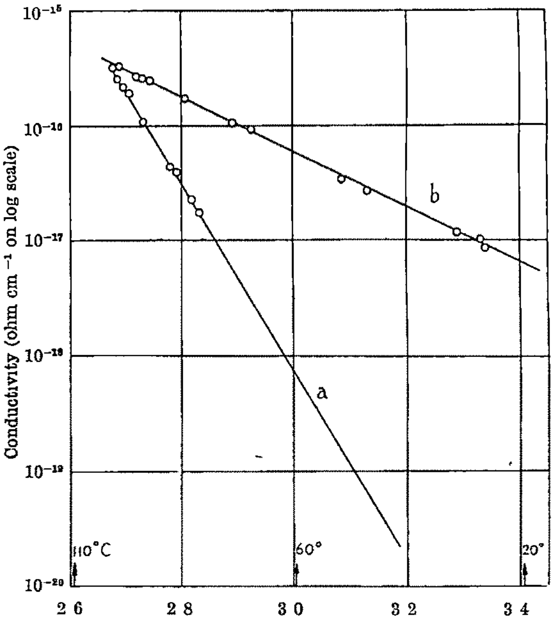

Fig 1

Table 1

Material	Δ at 80° C	Time to fall to 10 per cent at 80° C	Time to fall to 1 per cent at 80° C	Induced conductivity at 20° C for 7 r /min (ohm-cm)$^{-1}$
Polyethylene	0 8±0 05	3 min	30 min	10^{-16}
Polytetrafluoroethylene	0 62±0 05	6 hr	35 hr.	10^{-16}
Polystyrene	0 60±0 05	3 hr	20 hr	10^{-17}
Unplasticized 'Perspex'	0 55±0 05	10 hr	50 hr	10^{-17}

Table 1 lists the materials which we consider should grouped together because they display a markedly ponential distribution of traps in depth, as emplified by values of Δ which depart considerably om unity

It will be seen that the hyperbolic decay given by

$$\frac{1}{i_t} = \frac{1}{i_0} + At \qquad (3)$$

here i_t is the current remaining at time t, and A is constant characteristic of the material) is true over .e range 10–1 per cent decay for polythene but t for the other materials A full discussion of cay curve analysis will be given elsewhere, it is fficient here to say that equation (3) applies tween $t \approx 5$ min. and $t \approx 5$ hr, the decay coming exponential instead of hyperbolic at longer nes

It should be mentioned that the low conductivities easured here for unplasticized 'Perspex' will seldom obtained in practice owing to the effect of absorbed oisture.

A Semi-annual Periodicity in the Beginnings of Recurrent Magnetic Storm Series

Records of geomagnetic disturbances during the ven sunspot cycles from 1884 to 1954 reveal a ong tendency for the initial disturbance of a -day recurrent series to occur near January or ly Final disturbances of such series show this ndency only weakly.

This result was obtained from graphs of 3-day ving averages of the magnetic character figure C rough the years of declining sunspot activity, 84–91, 1895–1901, 1907–13, 1917–23, 1929–34, 38–44 and 1948–54, inclusive—a total of 48 years. l identifiable series of three or more recurrences re considered. A few series, and many individual sturbances, were of less than 'storm' intensity e method of analysis was to locate any apparent e of 27-day recurrence of magnetic disturbances, and to trace the series forward and backward in time as far as additional members could be identified. This procedure probably admitted a few random disturbances by time coincidence, but it dealt symmetrically with the initial and final members of each series.

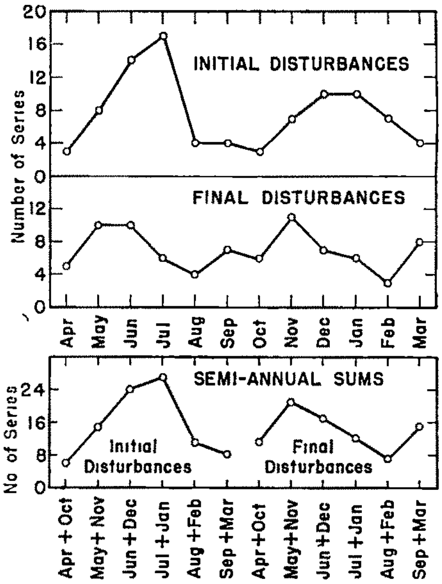

Fig. 1 Distributions of the initial and final dates of 27-day recurrent series of geomagnetic disturbances

When the dates of the initial disturbances of all the series so identified were tabulated by the calendar months in which they occurred (Fig 1), a plot of the resulting sums showed an unmistakable tendency toward a semi-annual periodicity with maxima about January and July Sixty-six of the ninety-one series began in the months May, June, July, and November, December, January, leaving only twenty-five during the other six months If the number of initial disturbances occurring in the same calendar month during a particular sunspot cycle is treated as a single datum, the probability that the observed difference between these two groups is the result of random fluctuations is about 10^{-4} The difference between the summer and winter maxima is not significant A similar analysis of the dates of the final disturbances of recurrent series suggested a weak semi-annual periodicity in phase with that of the initial dates, with the inconclusive probability 0 04.

The indication that most recurrent series begin on dates approximately midway between the equinoxes suggests a relation to the well-known maximum in recurrent storm activity near the equinoctial dates. Yet the wide range in the number of recurrences in a series (from 3 to more than 50, with a median of 18), together with the absence of a definite periodicity in the final dates of series, discourages any simple interpretation. The effect may be related to the fact that the earth crosses the plane of the solar equator on June 6 and December 7.

A tentative indication of a 23-year periodicity in recurrent storm activity, reported earlier[1], was not substantiated by this more extensive analysis

I wish to thank Dr. Walter O Roberts, director of the High Altitude Observatory of Harvard University and the University of Colorado where the research was done, Dr. Jean-Claude Pecker for suggesting

the use of the moving average plots, Mr. Fred Ward, of the Air Force Cambridge Research Center, for the use of his compilation of geomagnetic data, and Mrs. Eli Heitz, of the Observatory staff, for assistance in plotting the results The research was supported principally by the Radio Corporation of America.

Magnetic Structure of Manganese Arsenide

We have examined by neutron diffraction a number of samples of polycrystalline manganese arsenide, MnAs, prepared by Mr. A. Bentham by heating manganese and arsenic in a sealed quartz tube, with the view of confirming the antiferromagnetism postulated by Guillaud[1] in this material between the two transformation temperatures of about 40° and 130° C. No new reflexions due to antiferromagnetism have been observed, nor have we found any intensity changes within this region greater than the possible experimental errors. It seems clear that any antiferromagnetism must be very weakly developed. unfortunately, the precision of the experiment is much reduced by the fact that the important reflexions (0002) and (10$\bar{1}$1) are almost coincident in the powder diffraction pattern.

In the ferromagnetic region, from room temperature down to 80° K. which is the lowest temperature we have yet employed, the results suggest that the magnetic moments of the manganese atoms are not aligned along the c-axis, as was at first supposed, but, to a first approximation, are perpendicular to c

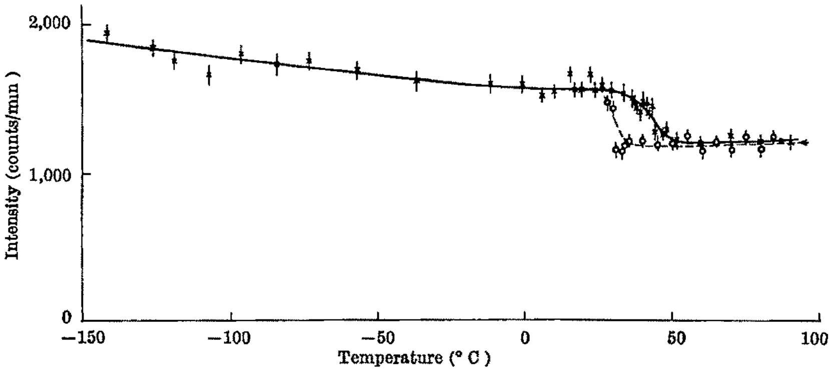

Fig 1 Neutron diffraction by manganese arsenide variation of intensity of 10$\bar{1}$0 reflexion with temperature ———, Heating, – – – –, cooling

We are at present engaged in the preparation of single crystals of the material, by fusion of manganese and arsenic in an atmosphere of argon at pressures of the order of 1,000 lb/sq in, with the hope of making a thorough investigation of the magnetic moment orientation from the much more intense and well-defined single-crystal neutron reflexions. Fig 1, which shows some results already obtained by partial isolation of a grain in a coarse-grained specimen, illustrates the power of the method. The (10$\bar{1}$0) reflexion from this grain had a peak count 1,600 neutrons per min, compared with 200 neutron per min. from a large powder sample: this coun was sufficiently large for the temperature-intensit curve to be plotted quite accurately as the substanc passed through the lower transformation temperatur due allowance being made for the change in uni cell dimensions[2] which was observed in the exper ments The temperature hysteresis in the trans formation, as indicated by the rise and fall of magnetic scattering with decrease and increase of temperature respectively, is clearly shown in Fig. 1.

It is hoped to publish a more detailed account this work at a later date

An Amplifier based on the Hall Effect

The very high electron mobility shown by the sem conducting compound indium–antimony, InSb[1], whe sufficiently pure, means that the power available fro the Hall effect is sufficiently high to make possib a number of new applications[2]. We have now bee able to achieve power amplification by using th effect in the following way.

The signal to be amplified, d.c. or a.c., is fed t a suitably matched coil wound on a laminated magnetic core, in which it induces a corresponding flu The core is closed except for a narrow gap into whic is inserted a thin rectangular slice of single-cryst indium–antimony Direct cu rent is made to flow throug the slice parallel to its lon axis, by means of soldere copper leads, the current b ing provided by a local batter The Hall effect due to th combined field and curre gives rise to an e m f. orth gonal to both. This is picke up by a pair of transverse lea and connected to a matche load. The current in the loa is then a replica of the origin signal.

In a first experimental a rangement a power gain of fi has been measured, but the is no theoretical reason wh much higher values should not be attained with single stage Cascading of stages presents no diffi culty An upper frequency-limit is set by core losse

We are indebted to the Admiralty for permissi to publish this communication

FORTHCOMING EVENTS

(*Meetings marked with an asterisk * are open to the public*)

Monday, March 21

Physical Society, Acoustics Group (at the Royal Institute of British Architects, 66 Portland Place, London, W 1), at 3 p m —Symposium on "Transducers"

Institution of Electrical Engineers, Radio Section (at Savoy Place, London, W C 2), at 5 30 p m —Discussion on "Materials for Valves"

Society of Chemical Industry (joint meeting of the Pesticides Group and the Agriculture Group, at the Chemical Society Burlington House, Piccadilly, London, W 1), at 5 30 p m —Meeting on "The Crop Protection Products Approval Scheme Part 3—"The Analysis of Fungicides" Mr J R Gray "Sulphur Products", Dr F R Cropper "Organo Mercurials"

Royal Society of Arts (at John Adam Street, Adelphi, London, W C 2), at 6 p m —Prof E N da C Andrade, F R S "Creep" Second of three Cantor Lectures on "The Mechanical Properties of Metals")

Institute of Metal Finishing (at Northampton Polytechnic, St John Street, London, E C 1), at 6 15 p m —Mr R J Heritage 'Electrodeposition of Aluminium"

University of London (at the London School of Hygiene and Tropical Medicine Keppel Street, London, W C 1), at 6 15 p m —Prof W A Fowler (California Institute of Technology) "Recent Developments in American Science" * (From a series of lectures on "The United States of America")

Monday, March 21—Wednesday, March 23

Institution of Chemical Engineers (at Church House, Westminster, London, S W 1)—O E E C Conference organized by the Institution on "The Functions and Education of the Chemical Engineer n Europe"

Tuesday, March 22

Physical Society (in the Lecture Hall of the Science Museum, Exhibition Road, South Kensington, London, S W 7), at 5 p m —Prof E C Stoner, F R S "Magnetism in Retrospect and Prospect"

Imperial College of Science and Technology (at the Royal College of Science, Imperial Institute Road, London, S W 7), at 5 30 p m —Prof A R Ubbelohde, F R S "Thermodynamics in the World To day" (Inaugural Lecture)

Royal Meteorological Society (at Trinity Grammar School for Boys, Wood Green, London, N 22), at 5 30 p m —Mr F H Ludlam "Clouds" (Meeting open to Sixth-form Scholars)

Institution of Electrical Engineers, Education Discussion Circle (at Savoy Place, London, W C 2), at 6 p m —Discussion on 'High-Voltage Equipment in Colleges"

Wednesday, March 23

British Psychological Society, Industrial Section (in Room 105, London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 1 p m —Mr Harold F Lock "Industrial Psychology—a Practitioner's Point of View" (Chairman's Address)

Royal Society of Arts (at John Adam Street, Adelphi, London, S W 1), at 2 30 p m —Prof A C B Lovell "Radio Astronomy"

Royal Statistical Society (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W C 1), at 5 15 p m —Prof A Thom "A Statistical Examination of the Megalithic Sites n Britain"

Eugenics Society (at the Royal Society, Burlington House, Piccadilly, London, W 1), at 5 30 p m —Mrs Hilda Lewis "Inadequate Parents and Psychological Disorders in their Children" *

Institution of Electrical Engineers, Supply Section (at Savoy Place, London, W C 2), at 5 30 p m —Mr J Christie, Mr H Leyburn and Mr J F Bird "Proving the Performance of Circuit-Breakers, with particular reference to those of Large Breaking Capacity", Mr J Christie, Mr H Leyburn and Mr R W Fenn 'A New Testing Station for High-Power Circuit-Breakers"

Society of Chemical Industry (joint meeting of the Food Group —Nutrition Panel and the Oils and Fats Group, at the Chemical Society, Burlington House, Piccadilly, London, W 1), at 6 30 p m —Dr S J Folley, F R S "Some Aspects of Fat Metabolism with Special Reference to the Biosynthesis of Milk Fat"

Thursday, March 24

Royal Society (at Burlington House, Piccadilly, London, W 1), at 11 a m —Discussion on "Hybrid Vigour", opened by Prof K Mather, F R S

Bone and Tooth Society (at the Institute of Orthopædics, 234 Great Portland Street, London, W 1), at 5 p m —Symposium on 'Repair Processes in Bones and Teeth"

London Mathematical Society (at the Royal Astronomical Society, Burlington House, Piccadilly, London, W 1), at 5 p m —Prof T M Cherry "A New Quasi-automorphic Function"

Mineralogical Society (in the Apartments of the Geological Society of London, Burlington House, Piccadilly, London, W 1), at 5 p m —Scientific Papers

Royal Society of Arts, Commonwealth Section (at John Adam Street, Adelphi, London, W C 2), at 5 15 p m —The Right Hon Lord Hailey "Post-war Changes in Africa"

Institute of Fuel (at the Institution of Civil Engineers, Great George Street, London, S W 1), at 5 30 p m —Mr W F B Shaw and Mr J W McHugo "Development and Use of the Calorimeter Building at the Fuel Research Station, Greenwich" *

Royal Aeronautical Society (at the Institute of Mechanical Engineers, 1 Birdcage Walk, London, S W 1), at 6 p m —Mr K V Diprose "Analogue Computing Applied to Aeronautical Problems"

Thursday, March 24—Saturday, March 26

University College London (joint meeting with the Physical Society, in the Department of Physics, Gower Street, London, W C 1) —Conference on "Recent Developments in Cloud Chamber and Associated Techniques"

Friday, March 25

Association of Clinical Biochemists, Southern Region (at the North Middlesex Hospital, Silver Street, Edmonton, London, N 18), at 3 p m —Business Meeting, followed by Scientific Papers

Royal Astronomical Society (at Burlington House, Piccadilly, London, W 1), at 4 15 p m —Discussion of papers received during the session

Physical Society (in the Lecture Theatre, Science Museum, Exhibition Road, London, S W 7), at 5 p m —Sir Geoffrey Taylor, F R S "Diffusion and Mass Transport in Tubes" (38th Guthrie Lecture)

Institution of Mechanical Engineers (at 1 Birdcage Walk, Westminster, London, S W 1), at 5 30 p m —Mr R C Worster and Dr D F Denny "Hydraulic Transport of Solids"

British Association of Chemists (at the Royal Society of Medicine, 1 Wimpole Street, London, W 1), at 8 p m —Dr P Haas "Some Aspects of the Chemistry of Seaweeds"* (Hinchley Address)

Royal Institution (at 21 Albemarle Street, London, W 1), at 9 p m —Mr George Boex "A Century of Aluminium"

Saturday, March 26

East Sussex County Council (at the County Grammar School for Girls, Lewes, Sussex), at 10 30 a m —Conference on "The Teaching of Science in Grammar Schools"

British Psychological Society, Education Section (at the Institute of Education, Malet Street, London, W C 1), at 2 30 p m —Prof Fred T Tyler (U S A) "Unity and Inter-relatedness in Human Development"

Royal Institute of Chemistry, London Section (at the University, Reading), at 2 30 p m —Symposium on "Chemical Aspects of Semiconductors"

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Assistants (2) (preferably with an honours degree in bacteriology or equivalent qualification) in the Department of Bacteriology—The Secretary, North of Scotland College of Agriculture, 41½ Union Street, Aberdeen (March 26)

Lecturer in Astronomy, and Lecturers (2) in Radio-Astronomy —The Registrar, The University, Manchester 13 (March 26)

Assistant Chemist (with a degree in chemistry of a British university and/or Associate of the Royal Institute of Chemistry) for work which will involve both chemical and bacteriological analyses of water under the supervision of the chief chemist, work outside the laboratory and in the field—The Engineer and General Manager, Water Board Offices, Corporation Road, Middlesbrough (March 31)

Lecturer (with a university degree and Corporate member of the Institute of Chemical Engineers, and preferably with some previous teaching and industrial experience) in Chemical Engineering, at Birkenhead Technical College—Director of Education, Birkenhead Education Committee, 63 Hamilton Square, Birkenhead (April 2)

Scientific Officers (3) (with a first- or second-class honours degree in a scientific subject, and with an interest in administration and organization of scientific research) in the Department of Scientific and Industrial Research, London Headquarters, for scientific administration—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A 67/5A (April 2)

Assistant Lecturer or Lecturer (with special interests in infrared spectroscopy) in the Department of Chemistry—The Registrar, University College, Singleton Park, Swansea (April 6)

Reader and/or Senior Lecturer in Mechanical Engineering, Lecturer or Assistant Lecturer in Mechanical Engineering, Senior Lecturer, Lecturer or Assistant Lecturer in Civil Engineering or Surveying, at the University College of Khartoum, Sudan—The Secretary, Inter-University Council, 1 Gordon Square, London, W C 1 (April 7)

Senior Laboratory Technician (with special training in embryology and histology) in the Department of Anatomy, University College, Ibadan—The Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W C 1 (April 7)

Assistant Lecturers in Applied Mathematics, Chemistry (with special reference to inorganic chemistry), Organic Chemistry, Geology (with special interests in palæontology), and Psychology —The Secretary, Birkbeck College, Malet Street, London, W C 1 (April 9)

Head of Chemistry/Physiology Group (Senior Principal Research Officer or Chief Research Officer grade) in the Division of Plant Industry, Commonwealth Scientific and Industrial Research Organization, Canberra—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2 (April 9)

Lecturer (preferably with research experience in polymer science) in Chemistry—The Registrar, The University, Manchester 13 (April 9)

Senior Biochemist (Principal Research Officer or Senior Principal Research Officer grade) in the Division of Plant Industry, Commonwealth Scientific and Industrial Research Organization, Canberra, to reorganize and develop a research programme in fields of relevance to basic problems of plant growth—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2 (April 9)

Lecturer or Assistant Lecturer in Mechanical Engineering—The Registrar, The University, Leeds 2 (April 11)

Chair of Chemistry at Makerere College, University College of East Africa—The Secretary, Inter-University Council for Higher Education Overseas, 1 Gordon Square, London, W C 1 (April 12)

Sir Jesse Boot Chair of Organic Chemistry—The Registrar, The University, Nottingham (April 13)

I C I Research Fellows in Bacteriology, Biochemistry, Biomolecular Structure, Botany (Plant Biochemistry and Biophysics), Chemical Engineering, Chemistry, Chemistry of Leather Manufacture, Chemotherapy, Colour Chemistry and Dyeing, Engineering (Civil, Electrical or Mechanical), Fuel and Refractories, Geology (including Geochemistry), Metallurgy, Mining (Selective Flotation and Geophysical Surveying), Pharmacology, Physics, Physiology of Textile Industries (Protein Chemistry and Wool Textile Engineering)—The Registrar, The University, Leeds 2 (April 15)

Chair of Electrical Engineering—The Registrar, The University, Edgbaston, Birmingham 15 (April 16)

Physicist or Mechanical Engineer (with a good honours degree in physics or mechanical engineering, or equivalent professional qualifications, and some experience in research and practice in the instrument field) at the Central Research Establishment, National Coal Board, Isleworth, Middlesex,- to carry out research concerned with the design and development of mechanical and electromechanical instruments required for mining research, including certain aspects of health and safety—The National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S W 1, quoting TT/944 (April 20)

Shell Research Student in Chemical Engineering—Shell Professor of Chemical Engineering, Department of Chemical Engineering, Tennis Court Road, Cambridge (April 23)

Lecturer (with experience in electron microscopy) in Biophysics—The Registrar, The University, Manchester 13 (April 25)

Assistant Lecturer in Agricultural Botany—The Registrar, The University, Reading (April 30)

Chair of Botany, and Chair of Geology—The Joint Clerk to the University Court, The University, St Andrews (April 30)

Chair of Mechanical Engineering—The Registrar, The University, Sheffield 10 (April 30)

Chair of Physical Metallurgy—The Registrar, University College, Singleton Park, Swansea (April 30)

Chair of Veterinary Pathology—The Registrar, The University, Liverpool (April 30)

Senior Lecturer in Physiology at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (Australia, April 30)

Chair of Anthropology at the University of Sydney, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (May 1)

Librarian (with a university degree in science and the qualifying certificate of the Library Association of Australia, or its equivalent, and with experience in a technical library), to take charge of a technical library serving the Division of Entomology, Division of Plant Industry and the Land Research and Regional Survey Section of the C S I R O, Canberra—Chief Scientific Liaison Officer, Australian Scientific Liaison Office, Africa House, Kingsway, London, W C 2, quoting 121/122 (May 7)

Esso Student in Chemical Engineering—The Registrar, Imperial College of Science and Technology, London, S W 7 (May 13)

Esso Students (2) in Chemical Engineering—The Registrar, University College, Gower Street, London, W C 1 (May 14)

Lecturer in the Philosophy of Science—Secretary of Faculties, University Registry, Oxford (June 1)

Esso Students (2) in Chemical Engineering—The Registrar, The University, Edgbaston, Birmingham 15 (June 11)

Senior Lecturer (with a higher degree (for example, Ph D) or equivalent qualification, and preferably with lecturing experience) in Physics, at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (June 15)

Chemist or Chemical Engineer (with an honours degree in chemistry or chemical engineering or equivalent qualifications) in the Operation Branch of the Industrial Group, U K Atomic Energy Authority, Risley, to be responsible for defining the technical requirements of the raw materials uranium and thorium, and for ensuring the suitability of ores and concentrates for use in the existing and proposed extraction processes within the Industrial Group—United Kingdom Atomic Energy Authority, Industrial Group Headquarters, Risley, Warrington, quoting 842

Chemist (with a first- or good second-class honours degree or equivalent qualification and considerable experience in general analytical work and in the rapid investigation of day-to-day problems) in the Central Laboratory, Chiswick—The Staff Officer (F/EV 528), London Transport, 55 Broadway, London, S W 1

Laboratory Technician (preferably with experience in instrument making) to develop a laboratory workshop and to assist in routine research and class preparation—The Secretary, University of Nottingham School of Agriculture, Sutton Bonington, Loughborough

Lecturer in Physics—Clerk to the Governing Body, Northern Polytechnic, Holloway, London, N 7

Physicist or Physical Metallurgist, Principal Scientific Office grade (with a first- or second-class honours degree in physics o metallurgy, and some years appropriate research experience), to lead a section carrying out basic and applied research into radioactive metals and alloys—The Senior Recruitment Officer, Atomic Weapons Research Establishment, Aldermaston, Berks, quoting 542/WGE/2

Physicist (with a good honours degree in physics or physical chemistry) in the Divisional Laboratory, Birmingham, for work which includes airborne dust measurement, microscopy settlement of fine solids in water and calibration of instruments—The Divisional Establishment Officer, National Coal Board, West Midlands Division, Himley Hall, Dudley, Worcs

Physicists, Grades 1 and 2 (with an honours degree in physics or equivalent) in the Research and Development Branch, U K Atomic Energy Authority, Risley, for liaison with the research and development laboratories and investigation of research requirements in the general fields of physics, reactor technology and physical metallurgy—United Kingdom Atomic Energy Authority, Industrial Group Headquarters, P O Box 19, Risley, Warrington, quoting 837

Physicists or Physical Chemists (with a good honours degree and preferably some research experience), for work which will involve both fundamental and applied research on textile fibres and related materials—The Appointments Officer, British Rayon Research Association, Heald Green Laboratories, Wythenshawe, Manchester

Research Assistants (2) in Physical Chemistry—The Clerk to the Governors, South-West Essex Technical College and Schoo of Art, Forest Road, Walthamstow, London, E 17

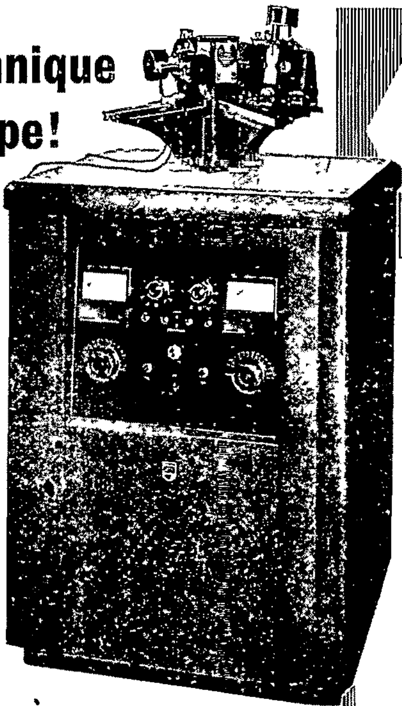
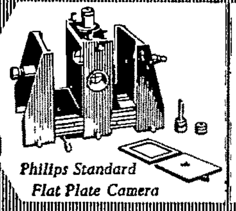
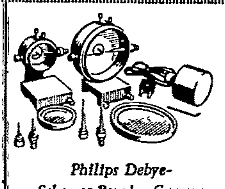
PHILIPS PW.1010

X-ray Diffraction Unit





Philips Standard Flat Plate Camera



Philips Debye-Scherrer Powder Cameras

SOME SALIENT FEATURES

- Always ready to switch on — Philips " sealed-off " X-ray diffraction tubes with four mica-beryllium windows
  High intensity, great spectral purity
- Detachable, shockproof, rayproof shield
- 4 rotatable 6-position filter discs and 4 electro-magnetically operated shutters — one for each of 4 windows
- Optimum stabilization of high tension and tube current
- Smoothed direct voltage adjustable between 10 kV and 54 kV
- Can be operated without supervision
- Goniometric recording with very accurate intensity measurements
- Weissenberg technique
- Any type of camera can be used

LECTURES AND COURSES

B Sc LONDON UNIVERSITY

Courses of Study for Entrance, Intermediate Science, and the final B Sc Examination (General or Special), are provided by UNIVERSITY CORRESPONDENCE COLLEGE, founded 1887 Also for other London University Degrees and Diplomas, G C E (all Examining Bodies), Pharmaceutical Society Intermediate, etc The College, an Educational Trust, has a staff of highly qualified Tutors Prospectus from Registrar (53), Burlington, House Cambridge

UNIVERSITY OF LEEDS

POSTGRADUATE SUMMER SCHOOL, 1955
SEPTEMBER 5 to 16
POLARIZATION MICROSCOPY AND
OPTICAL CRYSTALLOGRAPHIC METHODS

The course will deal with the theory and use of the polarizing microscope in chemistry and other branches of science and technology, and will consist largely of practical work The study of opaque materials by reflected polarized light and of fibres and biological material, will be included Tuition fee 15 guineas

Details from the Secretary, Department of Adult Education and Extra-Mural Studies, The University, Leeds, 2

OFFICIAL APPOINTMENTS

***The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged* 18 *to* 64 *inclusive, or a woman aged* 18 *to* 59 *inclusive unless he or she, or the employment, is excepted from the provisions of the Notification of Vacancies Order* 1952**

TEES VALLEY WATER BOARD

APPOINTMENT OF ASSISTANT CHEMIST

Applications are invited for the post of Assistant Chemist at a salary of £625 to £725 per annum (Grade APT III of the National salary scales) The work will involve both chemical and bacteriological analyses of water under the supervision of the chief chemist, and work outside the laboratory and in the field Applicants must hold a degree in chemistry of a British university and/or be Associates of the Royal Institute of Chemistry Some knowledge of biology will be an advantage The successful applicant must devote his whole time to the work of the Board and will be required to pass a medical examination The appointment will be subject to the provisions of the Local Government Superannuation Acts

Applications, stating age qualifications and experience, accompanied by three recent testimonials should reach the undersigned not later than March 31, 1955

T S R WINTER, M I C E , A M I W E ,
Engineer and General Manager
Water Board Offices
Corporation Road, Middlesbrough

UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Assistant Lecturer or Lecturer in the Department of Zoology The initial salary for an Assistant Lecturer will be £550 per annum The initial salary for a Lecturer will be within the range £650 to £800 per annum, according to qualifications and experience

Applications, stating age, experience and academic qualifications, together with the names of three referees, should be received not later than April 2, 1955, by the undersigned, from whom further particulars of the conditions of appointment may be obtained

STANLEY DUMBELL,
Registrar

BRITISH IRON AND STEEL RESEARCH ASSOCIATION

Assistant Technical Secretary (male or female) required in the Metallurgy Division at the Association's London offices A general science degree or equivalent qualification is essential, but experience in metallurgical analysis, metallography or physical testing would be advantageous Duties will be mainly concerned with the organization of committees and conferences and will involve some travelling and liaison with laboratories in Sheffield Starting salary up to £775 per annum, according to age qualifications and experience Post is superannuated under the F S S U

Written applications only, quoting "Assistant Technical Secretary," to the Personnel Officer, B I S R A , 11 Park Lane, London, W 1

BRITISH CAST IRON RESEARCH ASSOCIATION

has vacancies on its Research Staff for men aged 22-35, qualified in any of the following metallurgy, physics, chemistry, engineering Experience in connection with ironfounding not essential An excellent avenue of approach is provided to a career in an enterprising industry The investigators are required for work on dephosphorization (involving considerations of ore beneficiation, blast furnace practice, top blowing, slag/metal reaction, cupola operation, etc) solidification mechanisms melting furnace operation, graphite formation, mould/metal reactions, moulding sands, the properties of cast iron at elevated temperatures and other subjects Facilities are available for fundamental and for applied work Ample opportunity for travel, for continuous contact with industry, and ultimate employment within the industry The salaries will follow those of the Scientific Civil Service, and appointments will normally be in the Scientific Officer (£445 to £815 per annum), Senior Scientific Officer (£935 to £1,090 per annum) and Principal Scientific Officer (£1,090 to £1 472 per annum) grades, but special qualifications will receive consideration The Association is situated in the country, within easy reach of Birmingham and Redditch Superannuation

Applications to the British Cast Iron Research Association, Alvechurch, Birmingham, giving age, qualifications and experience

UNIVERSITY OF QUEENSLAND

AUSTRALIA

Applications are invited for the position of Lecturer (Grade I) in Chemical Engineering Salary £A 1 275 to £A 1,450 per annum Applicants should hold a degree in chemical engineering (either an engineering or science degree in chemical engineering or an applied science degree in chemical engineering or industrial chemistry), or an equivalent degree, together with professional experience in the subject, particularly in design and related aspects The degree and experience qualifications should be sufficient for acceptance to corporate membership of the Institution of Chemical Engineers Applications close April 30 1955

Further particulars are obtainable from the Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1, or from the undersigned

C PAGE HANIFY,
Registrar

UNIVERSITY OF SYDNEY

AUSTRALIA

Applications are invited for the position of Senior Lecturer in Physiology It is particularly desired that the successful applicant engage in research in the fields of cardiovascular or respiratory physiology The salary for a Senior Lecturer is within the range of £A 1,500 to £A 1 750 per annum, with annual increments of £A 50 The salary is subject to deductions under the State Superannuation Act The commencing salary will be fixed according to the qualifications and experience of the successful applicant Finance available for home purchase under Staff Member's Housing Scheme

Further particulars and information as to the method of application may be obtained from the Secretary Association of Universities of the British Commonwealth, 5 Gordon Square London, W C 1 The closing date for the receipt of applications in London and Australia, is April 30, 1955

TEA RESEARCH INSTITUTE OF EAST AFRICA

P O BOX 91, KERICHO, KENYA
CHEMIST

Applications are invited for the appointment of Chemist Applicants should have an honours degree in chemistry (biochemistry or agricultural chemistry) of a British university, and some research experience Salary scale £700 by £75 to £1,750 A starting salary above the minimum may be offered to a candidate with suitable experience Provident fund and free furnished quarters Home leave, six months after completion of three years service

Applications by airmail, giving the names of two professional and one personal referee should be sent to arrive before April 30, 1955 to the Director, from whom detailed information on conditions and duties are obtainable

Applications are invited for appointment as Lecturer or Assistant Lecturer in Mechanical Engineering the salary scales are at present under review but are expected to be such as to enable an appointment to be made on the scale £650 by £50 to £1 350 a year for a Lecturer or within the range £550 to £650 for an Assistant Lecturer according to age qualifications and experience

Applications (three copies), stating date of birth qualifications and experience together with the names of three referees should reach the Registrar the University, Leeds, 2 (from whom further particulars may be obtained) not later than April 11 1955

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for either an Assistant Lectureship or a Lectureship in the Department of Chemistry Candidates should be physical chemists with special interests in infra-red spectroscopy Salary scales Assistant Lecturer £450 by £50 to £550 per annum Lecturer £550 by £50 to £1,100 per annum Salary scales under review Commencing salary in each case will be at a point on the appropriate scale according to qualifications and experience Membership of F S S U and children s allowance scheme

Further particulars may be obtained from the Registrar University College Singleton Park Swansea to whom applications must be sent by Wednesday April 6 1955

MINISTRY OF SUPPLY NATIONAL GAS Turbine Establishment near Farnborough Hants, requires Experimental Officers and Assistant Experimental Officers for problems of combustion heat transfer aerodynamics projects and performance instrumentation and application of electronics in gas turbine research Qualifications, higher school certificate (science) or equivalent, but possession of a degree or higher national certificate in an appropriate subject may be an advantage for many of the posts A limited number of houses become available from time to time for successful candidates, if married Salary range Experimental Officer (minimum age 26) £715 to £880 Assistant Experimental Officer £288 10s (age 18) to £640 Women somewhat less—Application forms from Ministry of Labour and National Service Technical and Scientific Register (K) 26 King Street London S W 1 quoting C 146/5A Closing date April 9 1955

UNIVERSITY OF GLASGOW
LECTURESHIPS IN EXPERIMENTAL OR THEORETICAL PHYSICS

Applications are invited for Lectureships in Experimental or Theoretical Physics Salary scale Lecturer £650 by £50 to £1 350, Senior Lecturer £1 400 by £50 to £1 650 Grade of appointment and initial salary according to experience and qualifications F S S U and family allowance benefits Successful applicants will be expected to prosecute experimental or theoretical research in nuclear physics in addition to teaching duties

Applications (five copies) including the names of two referees should be lodged not later than April 30 1955 with the undersigned from whom further particulars may be obtained

ROBT T HUTCHESON
Secretary of University Court

UNIVERSITY OF MANCHESTER

Applications are invited for the post of Lecturer in Chemistry Preference will be given to candidates with research experience in polymer science Salary on a scale £650 by £50 to £1 350 per annum, initial salary according to qualifications and experience Membership of F S S U and children's allowance scheme

Applications should be sent not later than April 9 1955, to the Registrar the University Manchester 13, from whom forms of application and further particulars may be obtained

---

THE UNITED KINGDOM ATOMIC Energy Authority, Aldermaston, Berks require a Senior Scientific Officer or Senior Experimental Officer to assist in the scientific planning of overseas trials of atomic weapons The duties involve co-ordination of the scientific effort of each participating group, and require a full scientific appreciation of all aspects of the trials This will include liaison with Service and Civil Departments Minimum qualification for the Senior Scientific Officer post is a first- or second-class honours degree in science Applicants for a Senior Experimental Officer post should be at least 35 years of age and possess higher school certificate (science), but a pass degree preferably in physics would be advantageous The salary scales are Senior Scientific Officer, £1 040 to £1 205 (male) per annum and Senior Experimental Officer £1 090 to £1 285 (male) per annum The successful applicant will be required to join the Authority's Principal Superannuation Scheme and contribute 6 per cent of salary Housing will be available within a reasonable period for married officers who live outside the radius of the Establishment s transport facilities—Application form from Senior Recruitment Officer A W R E Aldermaston, Berks Quote Ref 531/WGE/34

LONDON TRANSPORT INVITE APPLICATIONS from chemists for post in Central Laboratory, Chiswick Candidates should possess first- or good second-class honours degree or equivalent qualification The post calls for considerable experience in general analytical work and in the rapid investigation of day-to-day problems, ability to prepare reports and to draft material specifications is also necessary Salary range £875 per annum to £965 per annum, with prospects of advancement to £1 035 per annum Certain free travel facilities, medical examination contributory superannuation scheme after probation—Applications to Staff Officer (F/EV 528), London Transport 55 Broadway, S W 1 For acknowledgement enclose addressed envelope

---

ROYAL AGRICULTURAL COLLEGE Cirencester invite applications for the post of Assistant Lecturer in Agricultural Botany from honours graduates in agricultural botany, and from those expecting to graduate this summer Candidates should have special interests in plant pathology Salary in the range £500 by £25 to £750 The post will be superannuated under the Federated Superannuation System for Universities—Further particulars may be obtained from the Bursar

---

ORGANIC CHEMIST REQUIRED AT ONCE to assist in the investigation of the structure of certain hormone-like substances of plant origin Experience in the structural chemistry of natural products desirable Appointment for one year in first instance Salary £600 to £750 according to qualifications—Applications, with the names of two referees to the Secretary National Institute for Research in Dairying Shinfield, Reading, within a fortnight of the appearance of this notice Quote reference 55/5

IMPERIAL COLLEGE
DEPARTMENT OF ELECTRICAL ENGINEERING

plications are invited for two Lectureships October 1, 1955 Candidates should possess od honours degree in electrical engineering preferably have completed a graduate appren- hip or have had similar industrial experience y within range £700 by £50 to £1,000 and up- ls, according to qualifications and experience, F S S U and family allowances Duties will de undergraduate and postgraduate teaching the undertaking of research

plications, stating age, academic qualifica- and experience, with the names of two ees, should reach the Head of Department, rial College, London, S W 7, by April 18,

ANIMAL HEALTH TRUST

plications are invited for the post of Director e Trust's Farm Livestock Research Station, h is being developed at Stock, Essex Veter- qualifications essential, good degree in ce desirable Salary within the range £1,750 100 to £2,250 per annum Federated Super- ation System for Universities

rther particulars from the Scientific Director, Animal Health Trust 14 Ashley Place, West- ter, London, S W 1 Latest date for receipt pplications, April 18, 1955

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

plications are invited for the post of Assist- Lecturer in Physics Salary in the scale £600 25 to £650 per annum, with F S S U and ren's allowances

plication forms, in duplicate, should reach Registrar, The College, Keele, Staffs, from n further particulars and application forms be obtained, not later than May 1 1955

IVERSITY OF NOTTINGHAM
LECTURER IN METALLURGY

plications are invited for the appointment Lecturer in Metallurgy Candidates should a good honours degree in metallurgy and rably also works experience Salary immedi- ppointment in the range £650 to £1,050, with ble advancement to £1,350, superannuation erated Superannuation System for Universi- and family allowance

nditions of appointment and form of applica- from the undersigned

H PICKBOURNE,
Registrar

ETALLURGIST REQUIRED TO JOIN A engaged on research into the manufacture properties of wrought metals and alloys, at Metal Working Laboratories of the British and Steel Research Association in Sheffield icants, aged 22 to 26, should have good de- be keenly interested in research and willing urther their knowledge of metallurgy and l physics as applied to the plasticity of metals mencing salary up to £750 per annum, de- ing on age and qualifications Post is super- ated under the F S S U —Written applications quoting "Metal Working," to Personnel r, B I S R A, 11 Park Lane, London, W 1

BORATORY TECHNICIAN GENERAL chemical laboratory experience essential botanical experience an advantage Salary vised scale for university technicians £340 15 bar to £480, point of entry depending on fications and experience —Apply to Professor otany, The University Edgbaston Birm ng- 15

TIONAL INSTITUTE FOR RESEARCH airying requires an Assistant Experimental r (female) as Personal Assistant to Head of ology Department Degree in biological ce or equivalent qualification, and good secre- qualifications essential Commencing salary rding to age in scale, £382½ (age 21) to £482½ 26 or over on entry) to £540 (maximum), superannuation —Applications with names wo referees, to reach Secretary of the Insti- Shinfield, Reading, within one week Quote erce 55/6

ST-DOCTORAL FELLOWSHIP AVAIL- for a physicist or physical chemist to work the physico-chemical properties of aerosols appointment will commence as soon as pos- , and in any case not later than September 55 The value of the Fellowship is £700 per m, and the appointment which will be made ne year in the first instance, will be renew- —Applications to The Clerk to the Governors, rsea Polytechnic, Battersea Park Road, lon, S W 11

UNIVERSITY OF ST ANDREWS

The University Court invites applications for the Chair of Botany in the University The Professor will be a member of the United College of St Salvator and St Leonard St Andrews The salary attached to the Chair is £2,200 per annum, plus F S S U and family allowances A grant towards expenses of removal may be made

Applications (30 copies), including the names of three referees, must be submitted by April 30, 1955, to the undersigned, from whom further particulars may be obtained

D M DEVINE,
Joint Clerk to the University Court

UNIVERSITY OF SHEFFIELD

Applications are invited for a post of Lecturer or Assistant Lecturer in Chemistry with special interest in Organic Chemistry, to begin duties on October 1, 1955 Salary scales Lecturer, £650 by £50 to £1,350, Assistant Lecturer, £550 by £50 to £650, with F S S U provision and family allowance Initial salary according to qualifications and experience

Further particulars should be obtained from the Registrar, to whom applications (three copies), should be sent by April 23, 1955

B E C C RESEARCH UNIT IN RADIOBIOLOGY
MOUNT VERNON HOSPITAL
NORTHWOOD, MIDDLESEX

Qualified Laboratory Technician required, to assist in care of animals and in biological experiments, and to prepare specimens for microscopical examination A knowledge of photography an advantage Appointment in Technician grade

Applications, with names of three referees to the Director

ROYAL FREE HOSPITAL

Technician required in early April for work in the Chemical Pathology Department and Diabetic Research Laboratory Applicants should hold the A I M L T (chemical pathology) or equivalent qualification, previous experience of clinical biochemical work would be an advantage There are facilities for original research

Applications, with full particulars to Secretary to the Board of Governors, Royal Free Hospital, Gray's Inn Road, W C 1

GRADUATES OF UNIVERSITIES OR PROfessional institutions in engineering or physics required for research in high frequency light current engineering, use of electrical equipment in inflammable atmospheres, electrical space and water heating Permanent employment qualifies for F S S U or equivalent pension scheme Starting salary £500 to £750, according to qualifications —Applications to be addressed to the Director, Electrical Research Association, 5 Wadsworth Road Greenford, Middlesex

D S I R REQUIRE THREE SCIENTIFIC Officers for scientific administration at London Headquarters Qualifications first- or second-class honours degree in a scientific subject, with interest in administration and organization of scientific research Some industrial experience and interest in personal contacts would be advantageous Inclusive annual remuneration for a 45½-hour week, £532 to £955 (men), £532 to £842 (women) Prospects of establishment if under 28 —Application forms from Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting A67/5A Closing date April 2, 1955

BRITISH ELECTRICITY AUTHORITY, REsearch Laboratories Leatherhead, require Metallurgists Candidates should have a university degree or equivalent qualification in metallurgy and preference will be given to those with experience in the behaviour of metals at high temperatures Salary N J B Grade 1, £1,100 to £1 450 per annum or N J B Grade 2 £925 to £1,275 per annum, in accordance with qualifications and experience —Applications, stating age, present position and salary and giving full details of qualifications and experience to D Moffat, Director of Establishments, Winsley Street, London, W 1, by March 31, 1955 Quote Ref AE 579

THE FULMER RESEARCH INSTITUTE HAS two vacancies for supervisory staff, starting salary from £1,500 to £2,000 per annum, according to age and experience Candidates should have good degrees preferably doctorates one in metallurgy and the other in physics, with experience of carrying out and directing research Posts are permanent after one year's probation and pensionable at not less than half the maximum salaries —Apply in writing to the Director, Fulmer Research Institute, Stoke Poges, Bucks

COLLEGE OF ARTS AND SCIENCE
BAGHDAD, IRAQ

Applications are invited for a Senior Lecturer in Geology, specializing in Stratigraphy-Palaeontology, to take up duties on or before October 1, 1955 Salary scale I D 1,400 to I D 2,400 per annum, depending on qualifications, plus a cost of living allowance ranging from I D 120 to I D 168 per annum The Government contributes 10 per cent and the employee 5 per cent of his salary to the Provident Fund The Iraq Government offers a contract for one year in the first instance, renewable by mutual agreement annually Passages for applicant, wife and up to two children are paid at beginning and end of contract

Further information may be obtained from Dr A A Duri, Dean Applications should be sent by airmail to the Dean

UNIVERSITY OF TORONTO
DEPARTMENT OF PHYSICS
OPENINGS IN GEOPHYSICS

A lecturer in exploration geophysics is required in the Department of Physics, University of Toronto Salary $4,000 Acquaintance with gravimetric, electromagnetic and seismic instruments essential, field experience desirable Appointment to commence September 1, 1955

Applications are also invited for a Research Fellowship made available through funds given to the university jointly by the California Standard Company and California Research Corporation, stipend $1,800, open to students with good standing in physics and preferably with some knowledge of geology The research may be either in the field of exploration geophysics or in physics of the earth

Apply to Professor W H Watson, McLennan Laboratory, University of Toronto, Toronto 5 Canada

UNIVERSITY OF CAMBRIDGE

Applications are invited for an Assistant Curator of Invertebrates in the Museum of Zoology The person appointed will be expected to take office from October 1, 1955 An honours degree in some branch of Natural Science including Zoology is essential Museum experience, though not essential, will be considered an advantage The initial salary is expected to be of the order of £750 a year, rising by annual increments of £25 to £1,050 a year

Full particulars can be obtained from Dr A S Watt, Botany Department, Downing Street, Cambridge, to whom applications (ten copies) and the names and addresses of not more than three referees should be sent, to reach him not later than May 1 1955

H M OVERSEA CIVIL SERVICE

Permanent and pensionable vacancies at present exist for Land Surveyors in the Survey Departments of the following territories East Africa Tanganyika West Africa Federal and Northern Regions of Nigeria, Sierra Leone There are also vacancies in the Directorate of Colonial Surveys Qualifications are (i) (a) a degree (preferably with honours) in engineering, mathematics, physical science, or geography and (b) intermediate R I C S (Land Surveying Section) or exemption therefrom (ii) Professional Associateship of R I C S (Land Surveying Section) (iii) Licence to practice as a Land Surveyor in Canada, Australia, New Zealand or South Africa Final-year honours men who take their degree examination in 1955 may also apply Post-selection training up to intermediate R I C S standard would be given to such candidates

Candidates should write, giving brief details of age qualifications and experience, to the Director of Recruitment, Colonial Office Oversea Service Division Sanctuary Buildings, Great Smith Street, London, S W 1 (quoting reference BCD 428/03) for further details of terms and conditions of service

LABORATORY TECHNICIAN WITH EXperience of food and toxicological analysis, required for University of Edinburgh Department of Veterinary Hygiene and Preventive Medicine Salary scale £340 by £15 to £415 bar £440 by £20 to £480 per annum —Applications giving particulars of age, qualifications and experience, along with two recent testimonials, should be sent to the Secretary to the University Old College, South Bridge, Edinburgh, as soon as possible

ASSISTANT LECTURESHIP IN INORGANIC Chemistry now vacant, scale £600 by £50 to £700 Teaching duties mainly analytical chemistry —Applications, giving references and particulars of research and teaching experience, should be sent to Professor Barrer Chemistry Department, Imperial College, London, S W 7

NATIONAL COAL BOARD

WEST MIDLANDS DIVISION

A Physicist is required for work at the Divisional Laboratory, Birmingham, with a good honours degree in physics or physical chemistry The field of work includes airborne dust measurement, microscopy settlement of fine solids in water and calibration of instruments, and a knowledge of one or more of these is desirable

Applications to the Divisional Establishment Officer, West Midlands Division, Himley Hall, Dudley, Worcs

CHANNING SCHOOL

LONDON, N 6

Part-time Chemistry Mistress (resident or non-resident) required for the summer term to teach the subject up to 5th form standard Subsidiary mathematics or general science an advantage A graduate, qualified to teach chemistry up to university scholarship standard and to teach some mathematics or general science in addition, would be considered for permanent full-time appointment New London Burnham Scale Government superannuation

Apply immediately, with full particulars and copies of testimonials, to the Headmistress

UNIVERSITY OF ST ANDREWS

The University Court invites applications for the Chair of Geology in the University The Professor will be a member of the United College of St Salvator and St Leonard, St Andrews The salary attached to the Chair is £2,200 per annum, plus F S S U and family allowances A grant towards removal expenses may be made

Applications (30 copies), including the names of three referees, must be submitted by April 30, 1955, to the undersigned, from whom further particulars may be obtained

D M DEVINE,
Joint Clerk to the University Court

WESTMINSTER HOSPITAL

ST JOHN'S GARDENS, LONDON, S W 1

Physics Workshop Technician required from March 28 1955 Whitley Council conditions of service Salary scale £450 to £515 per annum, plus London weighting Experience of laboratory prototype work in light engineering essential

Applications, naming two referees, to House Governor within ten days

UNIVERSITY COLLEGE OF WALES

ABERYSTWYTH

Applications are invited for the post of a Trained Technician in the Botany Department, to commence duties as soon as possible Commencing salary £340 per annum

Applications, giving the names of two referees, should be sent to the Registrar immediately

APPOINTMENTS VACANT

BAKELITE LIMITED HAVE A NUMBER of vacancies for Chemists in their Research and Development Department Up to five years industrial experience (not necessarily in the plastics industry) would be an advantage There are also vacancies for chemists who will graduate or who will complete their national service in the next six months The work of the department covers a wide range of polymers and plastic materials and, in addition to original work, involves development in this country of products and processes originating in the United States Candidates for these positions should have first- or second-class honours degree or equivalent qualifications —Applications should be addressed to Research and Development Director, Bakelite Ltd, Redfern Road, Tyseley, Birmingham, 11, and should give full details of age, training, qualifications, and experience

THE BRITISH PETROLEUM COMPANY Limited has immediate vacancies for Chemists, Chemical Engineers and Mechanical Engineers for work in their United Kingdom Refineries and at their Research Station at Sunbury-on-Thames Applications are invited from men with first- or second-class honours degrees or equivalent qualifications and who have fulfilled National Service obligations Previous industrial experience desirable but not essential Age preferably not above 33 Salaries within the range £600 to £1,200, according to qualifications and experience Excellent working conditions Non-contributory pension scheme —Write, giving full details, quoting H 3297, to Box 7352, c/o 191 Gresham House, E C 2

A I M L TECHNICIANS, OR EQUIVALENT standard, required for pharmacological work Male or female —British Schering Research Institute, Alderley Edge, Cheshire

NUCLEAR REACTOR PROJECT DESIGN STUDY GROUP

A unique opportunity is offered to young men with initiative and imagination, to study nuclear power and propulsion

Applications are invited for the following posts

(1) PROJECT ENGINEER, to carry out feasibility studies on small high temperature system Background in aero-engine design would be an advantage Knowledge of heat transfer and fluid dynamics essential

(2) RESEARCH METALLURGIST, to engage in research on new materials Some knowledge of high temperature alloys, ceramics or liquid metals would be an advantage

(3) PHYSICIST to engage in experimental research on existing reactors and assist in nuclear design calculations on new types

Some knowledge of nuclear physics is desirable for (3), but is not essential for (1) and (2)

Honours degree or equivalent qualifications essential

Age 23 to 30 years

Initial salary up to £1,000 per year, depending on age and experience

Reply, giving full details of career, to Box 658, T G Scott and Son, Ltd, 143-147 Regent Street, London, W 1

ANALYTICAL CHEMIST REQUIRED TO work in Department dealing with pesticide residues on crops, atmospheric contamination and mion analysis of organic compounds B Sc or A R I C standard necessary Previous practical experience desirable Salary according to age, qualifications and experience —Write (quoting No 1025), giving fullest particulars and salary required to Personnel Manager, Fisons Pest Control Limited, Bourn, Cambridge

RESEARCH AND DEVELOPMENT ENGINEERS are required for work on Electronic Switching, Computing and Control Apparatus Applicants should preferably have had experience of one or more of the above A good university degree in engineering or physics would be an advantage Further vacancies exist for Junior Engineers and Technical Assistants Excellent opportunities for advancement to more senior positions Starting salary, according to qualifications and experience, will be in the range of £400 to £1,100 per annum The Company operates a superannuation scheme and offers attractive working conditions with generous holiday and leave arrangements, and good social and recreational facilities —All applications will be dealt with in confidence and should be addressed to the Director of Research, British Telecommunications Research Ltd, Taplow Court, Taplow, Bucks

BOTANIST OR BIOCHEMIST BETWEEN 23 and 30 years of age required by Glaxo Laboratories Ltd at their Antibiotic Factory at Ulverston, Lancs Some previous experience of industrial fermentation would be a considerable asset and preference will be given to men with a particular interest in production and management problems Salary according to qualifications and experience with good prospects of advancement —Apply to Personnel Manager, Glaxo Laboratories Ltd, Greenford, Middlesex

GEOPHYSICISTS EXPERIENCED IN OIL exploration by means of the seismograph, magnetometer or gravity meter needed for positions outside of U K Good salary Foreign bonus and living allowance —Write details of age and experience to Box N 111, c/o 191 Gresham House, E C 2

PHILIPS BALHAM WORKS LTD, 45 Nightingale Lane, S W 12, requires Graduate in Electrical Engineering or Physics preferably with experience in electronics for development of nucleonic instruments Permanent appointment with excellent prospects —Applications should be addressed to the Personnel Officer at the above address

TECHNICAL LIBRARIAN

Courtaulds Limited requires a male Librarian/ Information Officer in its Textile Research Laboratory, Bocking, Essex Responsibilities include the administration of a medium-sized scientific and technical library, the editing of technical reports, the preparation of literature surveys, and the indexing of current publications Applicants with a scientific degree and some knowledge of textile science and technology preferred, but a qualification in librarianship or experience in a specialist library is essential A knowledge of German is required Age 25 35 Salary in accordance with age and experience

Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St Martin's-le-Grand London, E C 1, quoting the reference number D 65

PHYSICIST REQUIRED FOR *X*-RAY DIFfraction and other interesting physical investigations in a Metallurgical Research Laboratory Good prospects and scope exist Pension scheme —Apply, giving full particulars of age, qualifications and experience, to Box 669, T G Scott and Son, Ltd , 143-147 Regent Street, London, W 1, quoting reference PX

GRADUATES IN MATHEMATICS (FEMALE) required for the detailed analysis and tabulation of experimental data Previous experience not necessary —Applicants should write, giving full details to Personnel Department (E D /129), E M I Eng Dev Ltd , Hayes, Middlesex

---

A PHYSICIST IS REQUIRED TO FILL AN important post as Leader of a large Research Group on Solid State Physics He would be engaged solely on research and would work directly with the Chief Scientist, he would not be concerned with development The type of man envisaged is one having a well established reputation in the field of solid state physics and the salary offered would be commensurate with this —Application should be made to the Director Research Laboratories of the General Electric Company Ltd , Wembley, Middlesex (Ref RLH/21)

PLANT MANAGER REQUIRED FOR EXtraction Plant in East Africa Applicants should have chemical engineering knowledge and be capable of controlling European and native labour Responsible for plant installations and general maintenance Must be conscientious and undertake control of plant process Salary from £1,500 upwards according to experience Home leave, pension and bonus schemes —Write Box " MR/ 49," c/o 95 Bishopsgate, E C 2

AERODYNAMICISTS WITH A GOOD DEgree and several years' experience in aircraft or missile industry, required to work on a wide variety of dynamics problems associated with major guided weapon development Aerodynamicists with a degree or equivalent qualification, preferably with several years' experience in aircraft or missile industry required to work on analysis and development of flight trials of above weapon Competitive salaries paid for right men —Please write in detail, quoting Ref 119, to The Personnel Manager (Technical Employment), de Havilland Propellers Ltd , Hatfield, Herts

---

ANALYTICAL CHEMISTS ALBRIGHT & Wilson Ltd and Midland Silicones Ltd , have vacancies as under (1) Albright & Wilson Ltd require a qualified chemist who would act as Deputy to the Chief Chemist, for analytical duties and for research into analytical methods at their Merseyside Works The position bears responsibility and there are good prospects of advancement Age 26-30 (2) Midland Silicones Ltd require a Research Analyst in the laboratory of its factory at Barry Glamorgan for investigating and developing new methods for the analysis of organo-silicon compounds and intermediates associated with the manufacture of silicones Candidates, who should be aged 25 to 30 and possess an honours degree or A R I C should preferably have had experience of infra-red analysis These posts carry membership of a non-contributory pension scheme —Applications stating for which post intended, should be addressed to the Staff Officer, Albright & Wilson Ltd , P O Box 3, Oldbury, Birmingham

---

ORGANIC CHEMISTS REQUIRED FOR REsearch Department of Company manufacturing Technical and Fine Chemicals Honours graduates are preferred and some industrial experience is desirable although not essential The positions are permanent and pensionable and a salary up to £850, dependent on qualifications and experience, will be paid —Apply, Personnel Manager, Howards of Ilford Ltd , Ilford, Essex

---

NELSON RESEARCH LABORATORIES

ENGLISH ELECTRIC CO LTD ,

STAFFORD

have a vacancy for a PHYSICIST having an interest in solid state physics and electronics, to work on the fundamental properties and applications of materials suitable for use in electronic storage devices

An honours degree and some research experience are desirable

Salary at present-day levels in accordance with age and qualifications Please reply to Department C P S , 336-7 Strand, W C 2 quoting Ref 1353B

ATOMIC POWER DEPARTMENT

of

ENGLISH ELECTRIC

requires

MECHANICAL DESIGN ENGINEERS

This is an excellent opportunity for men with any type of medium or heavy mechanical design experience to enter this new field of engineering

Applications should be made to

Dept C P S ,
336-7 Strand, W C 2,
quoting Ref No 1318A

ATOMIC POWER DEPARTMENT

of

ENGLISH ELECTRIC

invites applications from

MATHEMATICIANS

who have or who will have in the near future, postgraduate qualifications in MATHEMATICS

Please write to

Dept C P S ,
336-7 Strand, W C 2,
quoting ref no 1367A

LABORATORY ASSISTANTS COURTAULDS Limited has vacancies for male Laboratory Assistants in its Maidenhead Research Laboratory Previous chemical laboratory experience is essential and applicants should have obtained general certificate of education in mathematics, physics/ chemistry and have completed their National Service —Candidates should write for a detailed form of application to the Director of Personnel, Courtaulds Limited, 16 St Martin's-le-Grand, London, E C 1, quoting the reference number D 59

CHEMIST OR PHYSICAL CHEMIST REquired for interesting work in connection with research on electronic valves Previous experience is not essential, but candidates should be of at least general degree standard Age 20-30 years Salary commensurate with age and qualifications A permanent, progressive post —Write, giving full information to the Personnel Officer, Ericsson Telephones Ltd , Beeston, near Nottingham

WOOL INDUSTRIES RESEARCH ASSOCIATION

Physicists with honours degree or A Inst P required for fundamental research on (i) Adhesion, friction and abrasion of non-metallic substances (ii) Physical adsorption by polymer materials, including infra-red measurements Previous research experience not essential, opportunity for proceeding to a higher degree Commencing salary according to age and experience in range £530 to £845 per annum, with F S S U benefits

Applications to Wool Industries Research Association Torridon, Headingley, Leeds, 6

WOOL INDUSTRIES RESEARCH ASSOCIATION

Physicist with honours degree or A Inst P required for weaving research The work involves experimental and analytical investigations on looms and in the laboratory, it requires mechanical aptitude and a liking for classical physics Previous research experience not essential Commencing salary according to age and experience in range £530 to £845 per annum, F S S U benefits

Applications to Wool Industries Research Association, Torridon, Headingley, Leeds, 6

THE METAL BOX COMPANY HAS A number of vacancies in its Research Division for Scientists and Technologists experienced in the plastics industry Men are required in three grades

Grade I One vacancy Salary £1,250 to £1,500 per annum

A Graduate in Chemistry or Chemical Engineering with several years' experience in the plastics and/or synthetic resin industries, capable of planning and administering a programme of research and development work to be carried out by a team of six or seven Scientists and Technicians Previous experience should include the field of plastics extrusion

Grade II Two vacancies Salary up to £1,000 per annum

(1) Man with scientific training, not necessarily a graduate, and with experience of development work in the plastics industry, preferably in the field of extrusion

(2) A Graduate in Chemistry or Chemical Engineering with a few years' experience of synthetic resins, in the plastics rather than the coatings fields Must have knowledge of the properties and working characteristics of a wide range of synthetic resins

Grade III Two vacancies Salary up to £600 to £700 per annum

Non-graduate Laboratory Assistants with a little experience qualifying them to work under the men in Grade II above

Applications, in writing, to Ref R S /24, Staff and Personnel Dept, The Metal Box Co Ltd, The Langham, Portland Place, London W 1

APPLICATIONS ARE INVITED FROM physicists with honours degrees or their equivalent for posts in the research laboratory of the British Thomson-Houston Co, Ltd The work involves investigations of photo-conductive materials and devices but previous experience in this field is not essential—Apply, quoting reference WNB, and stating age, qualifications and experience, to the Director of Research, The British Thomson-Houston Co Ltd, Rugby

LANKRO CHEMICALS LIMITED OF Eccles, Manchester, offer an unusual opportunity with considerable scope for a highly qualified chemist of proven ability Applications are invited for the post of Senior Research Chemist A high standard in organic chemistry with keen interest in physical chemistry and at least five years' industrial experience are required Some administrative experience is desirable The company manufactures plasticisers, surface active chemicals and auxiliaries for the leather and textile industries Salary will be by negotiation and a contributory pension scheme is in operation—Applications, giving full particulars, should be addressed to The Managing Director

LADY CHEMIST, GRADUATE OR H N C required for analysis of electroplating and allied solutions—Apply, Electro-Chemical Engineering Co Ltd 161 Queens Road Weybridge Surrey

GRADUATE CHEMIST, METALLURGIST or Chemical Engineer required, to deal with problems relating to the installation of electroplating plant and process control Applicants must have completed military service and be willing to travel—Apply, Electro-Chemical Engineering Co, Ltd, 161 Queens Road Weybridge, Surrey

RESEARCH

Vacancies exist in the Research Department of SIMON-CARVES LTD for a number of alert young Research Officers The fields of interest include fluidisation, flame combustion, discharge in gases, electro-precipitation, behaviour of small particles, certain aspects of reaction kinetics and applied thermodynamics and computation of physico-chemical data Reliable Experimental Officers and Assistants are also required for work in these fields and in the analysis and testing of fuels, by-products, industrial dusts, refractories, soils, and materials of construction

RESEARCH OFFICERS

Good degree essential Initial salary in range of £600 to £900, depending on experience (Ref F P 100)

EXPERIMENTAL OFFICERS

Essential requirements either degree or H N C (or equivalent) and previous experience Non-graduates must be 26 or over to qualify Starting salary in range £500 to £650 (Ref F P 101)

EXPERIMENTAL ASSISTANTS

Good G C E or O N C required Age range 21 to 26 Initial salary between £390 and £475 (Ref F P 102)

JUNIOR EXPERIMENTAL ASSISTANTS

Candidates should have a good G C E (English, Maths and 2 science subjects) Age range 17 to 20 Salary according to age (Ref F P 103)

Working conditions are excellent, scope is good There is a pension scheme in operation Write, quoting the appropriate reference, to Staff and Training Division, Simon-Carves Ltd, Cheadle Heath, Stockport

ENGINEER, WITH ELECTRICAL OR PHYSICIST degree, required for development work on testing equipment for telecommunication cables Permanent and pensionable position at salary commensurate with experience and qualifications—Please apply, giving full particulars, to Personnel Officer Southern United Telephone Cables, Ltd Dagenham Dock, Essex

PHYSICIST OR METAL-PHYSICIST REquired for *X*-ray Laboratory (industrial radiography and crystallography) Scope for long-term research as well as technological applications Good university degree essential Candidates would be given encouragement to gain wide research experience and the seniority which this appointment is intended to carry—Applications to Personnel Dept, Hadfields Ltd, East Hecla Works, Sheffield, 9

Advertisers please note You must ad “Apply Employment Exchange” unless th employment advertised or the workers required are excepted under the Notification o Vacancies Order

THERMODYNAMICISTS WITH DEGREE equivalent qualification are required for work wide variety of problems concerned with tempe ture control and air conditioning for high spe flight A number of vacancies also exist Technical Assistants in the above field (R 125)—Please write in detail, quoting Ref of position sought to The Personnel Mana (Technical Employment), de Havilland Propell Ltd, Hatfield, Herts

THE DUNLOP RUBBER COMPANY SEE to appoint Physical Chemists for research and velopment concerning natural and synthetic lati Specialist knowledge or experience of coll chemistry or in the field of surface activity wou be an advantage but is not essential Applica should preferably have an honours degree or equivalent and should have completed Natio Service—Applications, in writing, quoting ref ence J M 64, giving details of age, qualificati and experience, to Personnel Manager Dunl Rubber Co Ltd, Fort Dunlop, Erdingt Birmingham, 24

APPOINTMENTS WANTE

BIOLOGIST EXPERIENCED TEACHE some research, and engineering experien Whole-time or vacation work—Box 674, T Scott and Son, Ltd, 143-147 Regent Stre London, W 1

GRANTS & SCHOLARSHIP

IMPERIAL COLLEGE OF SCIENC AND TECHNOLOGY

DEPARTMENT OF CIVIL ENGINEERING
BURSARIES IN CONCRETE TECHNOLOG

Notice is hereby given that the election Bursaries in Concrete Technology tenable as fr October, 1955, will take place in June, 19 Candidates must hold a degree in engineering the time of taking up the award, and must a have a good knowledge of the theory of structur Bursaries are of the value of £350 per annu out of which the College Tuition Fee has to paid, the amount may be increased to £450 those with industrial experience In addition, o or two Senior Bursaries of £600 per annum m be awarded to outstanding men with a minim of three years experience in industry The cou will be postgraduate and Bursars who successfu complete the course will be eligible for the aw of the Diploma of the Imperial College (D I

Applications must be received on or before J 1, 1955, by the Deputy Registrar, City and Gu College, Exhibition Road, London, S W 7, w will, on written request, send full information a application forms

COLLEGE OF AERONAUTICS

ENGLISH ELECTRIC RESEARCH FELLOWSHIP IN AERONAUTICS

Applications are invited for a Research Fell ship which has been established at the College the English Electric Co Ltd The Fellowship intended to provide opportunity for postgradu research into problems of vibration or stabil and control of aircraft, and is tenable for o year beginning on or about October 1, 19 The value of the Fellowship is £500

Applications, giving full particulars of edu tion and experience and quoting the names three referees, are required by May 1, 1955, a should be addressed to The Warden, T College of Aeronautics, Cranfield, Bletch Bucks

SALTERS' INSTITUTE OF INDUSTRIAL CHEMISTRY

GRANTS-IN-AID

The Committee will, in July, allocate a limi number of Grants-in-Aid to young men a women employed in chemical works in or n London, who desire to extend their education a career in chemical industry Applicants m not be under 17 years of age and must ha matriculation or its equivalent

Applications should be made as soon as p sible, whereupon forms will be issued requir particulars of age, nature of employment and manner in which the Grant would be used T application forms should be received, complete before May 16, 1955, by The Clerk of the Salte Company, Salters' Institute of Industrial Che istry 36 Portland Place, London, W 1

COLLEGE OF AERONAUTICS

Applications are invited for the Perring Scholarip in Aeronautics, valued £400 per annum, nable at The College of Aeronautics The sucssful candidate will be admitted to the twoar course at the College Applicants should eferably be honours graduates or final year dergraduates in engineering, mathematics or ysics, applications from non-graduates with mparable qualifications will also be considered ndidates must be British subjects domiciled in United Kingdom

Forms of application and statement of condions will be forwarded on written application to e Warden, The College of Aeronautics, Cranld Bletchley, Bucks The closing date for the cipt of applications is June 1, 1955

UNIVERSITY COLLEGE

LONDON

ESSO STUDENTSHIPS IN CHEMICAL ENGINEERING

Applications are invited from men who hold or pect to hold a good university degree in emical or other branch of engineering or in emistry for two Esso Studentships, founded by Esso Petroleum Co Ltd, tenable from Octo- 3, 1955 The value of the studentships is 50 a year, plus college fees

Applications should be submitted to the gistrar, University College, Gower Street, ndon, W C 1, by May 14, 1955, giving full rticulars of educational qualifications, industrial perience (if any), National Service and outside erests, together with the names of two referees

UNIVERSITY OF BIRMINGHAM

ESSO STUDENTSHIPS IN CHEMICAL ENGINEERING

Applications are invited from men who hold or pect to hold a good university degree in chemi- or other branch of engineering or in chemistry two Esso Studentships, founded by the Esso troleum Company, Limited, tenable from Octo- 1955 The value of the studentships is £350 year, plus university fees

Applications should be submitted to the gistrar, University of Birmingham, Edgbaston, rmingham, 15, by June 11, 1955, giving full rticulars of educational qualifications, indusal experience (if any), National Service and tside interests, together with the names of two erees

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

LONDON, S W 7

ROYAL DUTCH SHELL STUDENTSHIP IN GEOPHYSICS

This studentship is open to honours graduates in physics or geology (with mathematics and physics at intermediate level) for a two-year course from October, 1955, in Geophysical Prospecting applied to the search for oil Value £430 per annum, less fees £60 per annum

Applications must be received before June 1 1955 Further particulars from Registrar, Imperial College, S W 7

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

ESSO STUDENTSHIP IN CHEMICAL ENGINEERING

Applications are invited from men who hold or expect to hold an honours degree in chemistry or engineering for the Esso Studentship, founded by the Esso Petroleum Company, Limited, tenable from October 4, 1955 The value of the studentship is £350 a year, plus college fees

Applications should be submitted to the Registrar, Imperial College London, S W 7, by May 13, giving full particulars of previous industrial experience (if any) National Service, and academic qualifications The names of two references should also be given

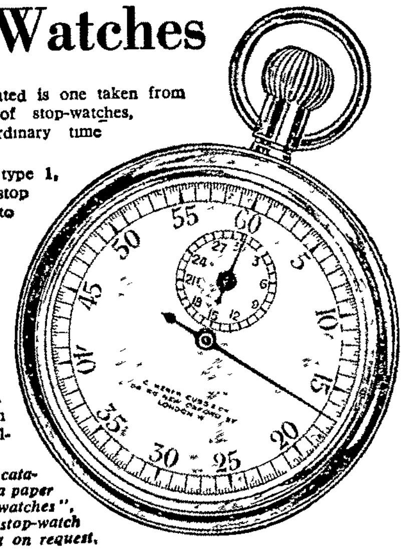
Director *for the Textile Research Institute, Bombay*

Applications are invited for the post of Director of the Textile Research Institute, Bombay, which will deal with fundamental and applied research in all branches of the cotton textile industry. The candidates must be physicists, chemists or textile technologists with an outstanding record of research Administrative experience and evidence of ability to plan laboratories and to organize and direct an extensive programme of research will be important considerations. Remuneration will be commensurate with the high responsibility of the post. The Director will be provided with a residence at a nominal rent, will receive a car allowance, and will be entitled to provident fund benefits The appointment will be for a period of five years in the first instance

Applications (6 copies) must reach the Secretary, Millowners' Association, Veer Nariman Road, Bombay, 1, India, not later than June 1, 1955

Stop Watches



THE stop-watch illustrated is one taken from our new catalogue of stop-watches, chronographs and ordinary time of day watches

It is Model 01—a type 1, three-pressure action stop watch, recording up to 30 minutes One revolution of the large hand equals 60 seconds

In view of its relatively low cost and high accuracy the watch is very suitable for general laboratory use A 1/10th second watch model 03 is also available

A copy of our new catalogue, which includes a paper " Some notes on stop watches ", is of interest to all stop-watch users and will be sent on request.

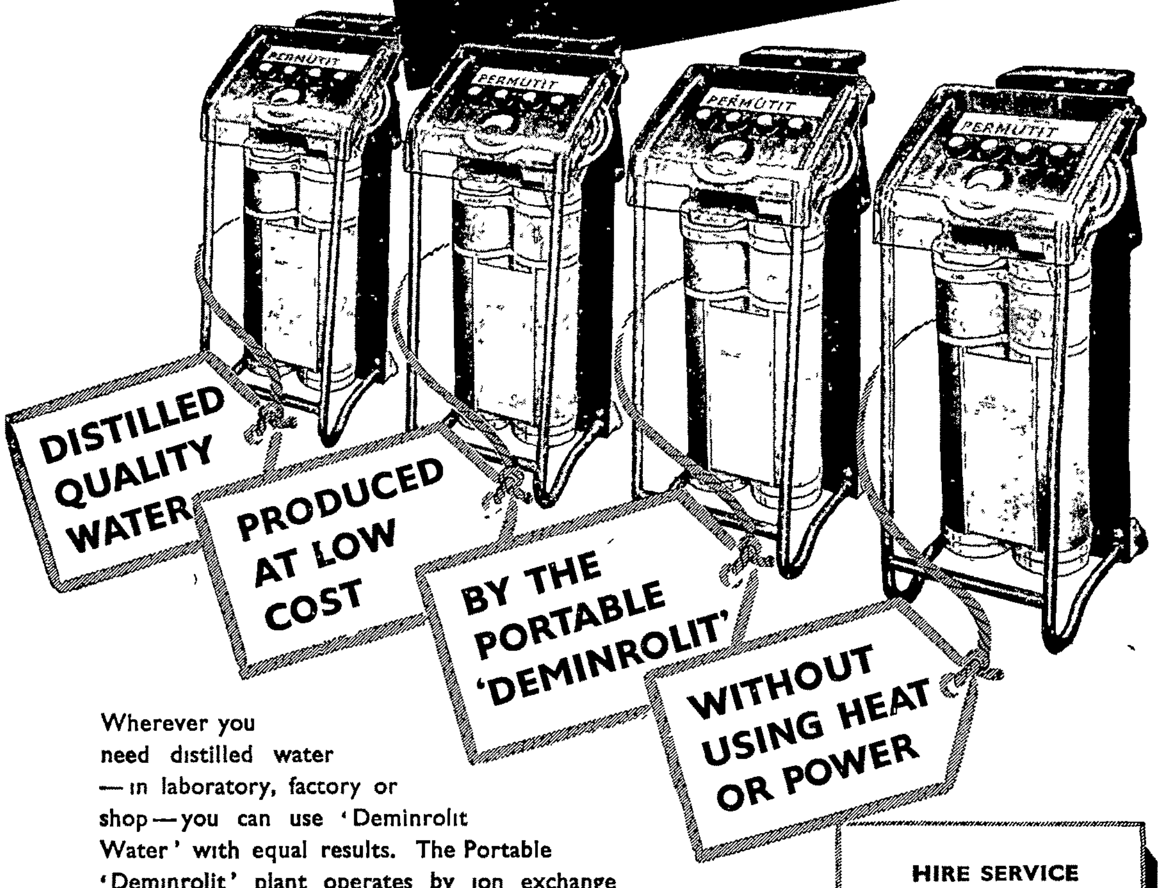
DISTILLED QUALITY WATER



Wherever you need distilled water — in laboratory, factory or shop — you can use 'Deminrolit Water' with equal results. The Portable 'Deminrolit' plant operates by ion exchange and delivers water substantially free from dissolved solids. Running costs are measured in pence instead of in pounds, and you can thus use distilled quality water for many purposes where the cost of distillation would prove prohibitive
Please write for Technical Publication No. 62 which gives full details.

HIRE SERVICE

Why not try demineralised water in your industry? You can do so easily and cheaply by hiring from us, at a nominal rental for a trial period, the latest Mark II Model Portable 'Deminrolit' Plant. Details of this service will gladly be supplied on request.

High Performance

VOLTAGE STABILISERS
and
REFERENCE TUBES

Close tolerance burning voltages
Wide range of operating temperature
Good stability over life
Freedom from output voltage "jumps"
Long operating life

NOW

ALSO AVAILABLE IN
SPECIAL QUALITY RANGE

The high performance of Mullard stabilisers has been improved even further by the introduction of *Special Quality* types, which will operate satisfactorily under rigorous conditions of shock and vibration. These special versions of normal production types combine extra-rugged construction with what has proved to be an inherently reliable principle of design, and they will be available in addition to the normal range.
Samples selected from every production batch of *Special Quality* tubes are tested against Services' specifications to withstand impacts of 500g and vibration of 6g at 175 c/s
All three of the *Special Quality* tubes can be supplied with either pin or flying lead bases Your enquiries for further details of these and other stabilisers in the Mullard range are welcomed at the address below.

Special Quality Type No.		Electrical Equivalent		Burning Voltage (V)	Current Range (mA)	Maximum Ignition Voltage (V)
Pin Base	Flying lead Base	Mullard	British Services

The case of *Agriotes obscurus* . . .

Wherever potatoes are grown, wireworms are pretty certain to be encountered and to damage the tubers In the U K , for example, this destructive pest populates the soil in some areas to the extent of over a million per acre. In heavy local infestations this figure is probably doubled Damage fluctuates, but it is nothing unusual to find over half a crop unfit for the table

With wireworms on the increase, British farmers have welcomed the arrival of aldrin This year in the United Kingdom alone over 90,000 acres of potatoes will be protected, mostly with aldrinised fertilizer This Shell insecticide is the most impressive destroyer yet discovered for pests in the soil—non-tainting and exceptionally suitable for compounding with fertilizer

Just 2½ lbs of aldrin per acre guards potatoes from wireworm and other soil pests right through the growing season

Aldrin is fast becoming recognised as being the best of all soil insecticides A little goes a long way and lasts a long time Now in world wide use, aldrin gives full control of many pests previously difficult to 'get at' economically

Another recently developed Shell insecticide is dieldrin *possessing exceptional persistence On foliage,* dieldrin *controls a very wide range of weevils, beetles, flies and other crop-eating insects It is also extensively used as a residual spray against disease-carrying insects*

Have you a stubborn pest problem to be solved?

aldrin

aldrin and dieldrin are SHELL insecticides for world wide use

CASEIN

LOW VITAMIN CONTENT

IN THE FIELD OF RESEARCH on animal nutrition a Casein of low vitamin content is required as a vitamin-free animal protein base *Casein — low vitamin content* — as supplied by Whiffens, has a protein content of not less than 90%. The process by which it is made is designed to remove both fat and water soluble vitamins, making the product suitable for the usual biological depletion procedures. It conforms to the following general specification:—

Appearance	**Cream coloured powder**
Loss at 100°C	**Not more than 5%**
Protein (by Nitrogen)	**Not less than 90%**
Ash	**Not greater than 2.0%**
Aneurine Hydrochloride	**Not greater than 1 pt. per million**
Riboflavin	**Not greater than 0.25 pt. per million**
Nicotinic Acid	**Not greater than 1 pt. per million**
Pantothenic Acid	**Not greater than 0.75 pt. per million**

Analyses of individual batches are available on application.
Available in units of 3 Kgs packed in hermetically sealed tins

Each consignment of CASEIN-LOW VITAMIN CONTENT is identified by a batch number

INTERPRETATION OF SCIENTIFIC PROGRESS

AS has already been noted in these columns (*Nature*, March 12, p. 439), Dr J. H Hilde- and's recent address to the American Philosophical ciety puts both the social responsibility of the ientist and the question of security in their proper rspective as involving problems in communication d in human relations. While, however, those prob- ms of human relations have been discussed compara- vely fully—for example, in such books as those of of W Gellhorn, Alan Barth and Prof H S Com- ager, and in relation to particular individuals like r J. R Oppenheimer, Dr. A V. Astin and Prof wen Lattimore—the problems of communication ve received nothing like adequate attention Such oblems, however, have a vital bearing on the ccess of any security programme based on those sitive conceptions of security which are expressed the recent statement from the American Association r the Advancement of Science

This problem of communication has been discussed om slightly different aspects in three recent addresses· H. L. Dryden's talk on the scientist in contem- rary life before the Cosmos Club, Washington, on ovember 16 , in Dr. J. R Oppenheimer's address at e concluding celebrations of the bicentenary of the unding of Columbia University on December 26 , d in the public lecture on "Science and Citizenship" hich Dr. Eric James delivered at the annual meeting the Science Masters' Association on December 29 ll three addresses were concerned with the isolation the scientist from the community and the way in hich effective communication could be established, us eliminating the dangers which this isolation reatens both in defence and in the effective appli- tion of science to national welfare and development.

Dr Oppenheimer's address was ostensibly on what d been chosen as the main theme of the Columbia niversity anniversary celebrations of the past year, mely, "Man's Right to Knowledge and the Free se Thereof" ; but he dealt more specifically with e prospect in the arts and sciences, and above all e emphasized the isolation of the specialist from the oad path of human knowledge and intercourse ith more means of communication than ever before, e can speak to each other less easily and less fectively. While more people are engaged in ientific research to-day, more books are published r head in Britain than in the United States, the cial sciences are pursued actively in America, andinavia and Britain, and more people both hear d compose music and paint, the frontiers of science e now separated by long years of study, by special- ed vocabularies, arts, techniques and knowledge om the common heritage even of the most civilized ciety The artist, too, finds it increasingly difficult achieve the community of experience, and common ays of describing it and interpreting it. The mmon sensibility and culture, the traditions and e history, the myths and the common experience hich it is his function to illuminate and to harmonize and to portray have been dissolved in a changing world.

Dr. Oppenheimer thus emphasized not simply the isolation of the scientist working at the frontier of science, but also showed that the artist and other creative workers are equally involved in this isolation. Moreover, he recognized the inevitability of the specialization of science, just as frankly as he admitted that these are heroic days in the natural sciences and likely to remain so. He emphasized also the dangers that arise when so much that is beautiful and enlightening, as in the experience of the artist, is cut off from the rest of the world. What is new, he insisted, is that in one generation our knowledge of the natural world has engulfed, upset and complemented all previous knowledge of the natural world Our techniques of communication and production and multiplication are new So are also the global quality of the world, our knowledge and sympathy with remote and diverse peoples, our practical involvement with them and our commitment to them in terms of brotherhood In this world in which we have come to live, the massive character of the dissolution and corruption of authority in belief, in ritual and in temporal order are also new

The difficulties which face us are thus derived from the growth of skill, of power, and of our understanding of that world, if not of the conditions which govern their exercise. To assail such changes is futile we need to recognize them and to take account of our resources , nor does Dr. Oppenheimer appear to put high among such resources the mass media of radio and television, the cinema, best-seller or the world tours of successful theatrical productions Although art and science may be purveyed by such means, they have also an inhumanizing influence and can easily destroy the individual sense of beauty

Dr. Oppenheimer concluded this address with a plea to keep our minds open and to keep them deep, to retain our sense of beauty and our occasional ability to see it in places which may be remote and strange and unfamiliar. This, he recognized, will be no easy task , but it is the condition of man and in this condition we can help because we can love one another. On that note he closed, and not with the emphasis on the open house, with no doors and no locks, of which he spoke in his Reith Lectures a year earlier The open access to knowledge may still be recognized as a fundamental freedom and as one barely compatible with modern political tyranny , but there is less confidence in our ability to achieve the harmony between knowledge in the sense of science and the community of man The secrecy—the bonds of man's own making—threatens the open society, the unrestricted access to knowledge, the unplanned and uninhibited association of men for its furtherance, and thereby the possibility of making a human community out of the complex, ever-growing and ever-changing, ever more specialized and expert technological world.

The brotherhood or community of which Dr Oppenheimer spoke rests on understanding, and here Dr Dryden strikes the same note. Science, he points out, has made major contributions to our spiritual life as well as provided powerful tools for shaping our physical environment. It places a high premium on intellectual honesty and on objective truth, and the successes of science and their impact on every aspect of life have captured the imagination and loyalties of many men as the only guide to truth.

Nevertheless, science is only a partial view of life—in many respects a narrow view—and the consequences of failure to understand this can be the more serious in that science is also amoral. Dr Dryden believes with A. H. Compton that our hope for the future rests in a growing understanding of the conditions for the good life of man in a world of science and technology, and the acceptance of a morality that is consistent with these conditions. It is not sufficient, however, for scientists themselves to recognize all this, and to realize their own limitations, as well as their responsibilities for the proper use of science for human welfare. These responsibilities are, in fact, the same as those of other citizens, no more, no less; and it is imperative that those responsible for the leadership of the community should be capable both of integrating the specialized knowledge which is involved in matters of public policy and also of maintaining high moral and spiritual standards.

Dr Dryden was concerned particularly with this last factor, neglect of which, for example, in the Oppenheimer case and in the case of the U.S. Bureau of Standards and the battery additive, he regarded as primarily responsible for the discord between scientists and the Government in the United States; he believes this to be much more serious in its effects than the failure of the Government to appreciate the importance of fundamental research as the basis of progress even in applied research and to provide for generous and continuous support. Once again, it is a matter of public understanding, of the understanding of the scientist by his fellow citizens, as well as of the understanding by the scientist of those public responsibilities of which Dr Eric James spoke. Moreover, in pleading for an increasing recognition of the social and moral responsibilities, Dr James was not at issue with Prof. A. V. Hill's view that there is no such thing as 'the scientific mind', but that, like all good citizens, scientists must take account of ethical considerations. Dr James was pleading rather for less complacency over present methods of education and for a more deliberate attempt to devise a system of scientific education that would produce the citizen, the Civil servant or the statesman at least as capable as those produced by the Oxford 'Greats' course.

Dr. James thinks that the means of mass communication alone, the radio and television, tend to create an uncritical, acquiescent public. This in itself threatens active citizenship and makes it accordingly the more important that the scientist and, it might be added, all those holding administrative responsibilities in government, should endeavour to disseminate information in such a wa that the ordinary educated man or woman is able t understand the social and political implications o scientific knowledge. Merely to enumerate some o the major topics discussed in Parliament this sessio would demonstrate the extent to which wise politica decisions in public policy turn on an understandin of scientific and technical issues. In matters of roa and rail transport, defence, atmospheric pollution, o nuclear power, neglect of scientific and technica factors could be disastrous. Although they are no the critical factors, at least it can be said that an policy which neglects or disregards them for som purely political party prejudice will endanger th national welfare, if not, indeed, national security.

Ignoring for the moment the extent to which th question of general education at the secondary o even the primary level is involved, we are concerned with the gradual spread of knowledge in th community through the improvement of means o communication and the disappearance of obstacl to their full employment. Dr Vannevar Bus recently spoke on these matters to the America Society of Mechanical Engineers. There is, of cours implied in that hope the assumption that with suc knowledge will come true wisdom; and whether th assumption can wisely be made depends at least in pa on the means of communication. That may well brin us right back to Dr Oppenheimer's Reith Lecture

In his book on "The Crisis in the University", S Walter Moberly rightly said that we need not onl discoverers of facts hitherto unknown but al explorers of ideas and rethinkers of values. We a concerned with the improvement as well as th extension of knowledge, and we need more thinkin about the importance of things already known. Book which throw new light on the significance and inte relations of facts already known perform a functio no less important than works of research in a narrow and more technical sense. They help us to get clos to the heart of things and sometimes give a ne meaning to familiar objects.

The most successful of the Reith Lectures ha been those which have done exactly that. Institute in 1948, these Lectures were intended to provide a opportunity for some acknowledged authority to giv listeners, in a series of some half-dozen half-hou talks, the results of study or research on some chose theme. It was hoped that such a series of serious talk would add to the pool of knowledge and stimula thought as well as widen public understandin That this hope was soundly based is to be see from the discussion which broke out last year ov Dr Oppenheimer's lectures, "Science and th Common Understanding"*. The Reith Lectures we rightly seen as a problem in communication, thoug on a vaster scale than that of the serious lecture o earlier generations. When it was argued that D Oppenheimer's talks had failed to make any re impact on the ordinary listener, the question wa promptly raised whether this was merely an illus ration of the common failure of communication between the physical scientist and the layman to-day, or whether something more was involved

---

* Science and the Common Understanding. By J. Robert Oppenheimer. (The B.B.C. Reith Lectures, 1953.) Pp. vii+127. (London Oxford University Press, 1954.) 10s. 6d. net.

In so far as there was failure of communication, t is clear from the published lectures that the responsibility lies on our system of education as much as on the scientist The lecturer is inevitably limited by the listener's own understanding of science, and failure to grasp Dr Oppenheimer's message is in part n consequence of our neglect to ensure that those eaving our schools to-day have a general understanding of what science is and the part it plays in the world in which they have to live That, incidentally, is a further reminder of the seriousness for the community of the continuing scarcity of science eachers in the schools, quite apart from its effect on the supply of scientists and the technologists them-elves

What emerges, however, from the discussion provoked by these particular Reith Lectures is not imply the importance of a wider public under-tanding of science, or of scientists taking more care n this matter of communication it is the limitations of the specialist as expositor Despite Dr Oppenheimer's intense and wide human sympathies, when he moved outside the sphere of his own special competence he tended to become trite and commonplace Prof. Hill's argument that scientists for the most part are quite ordinary folk outside their own pecial field was well illustrated. The task of xposition, in fact, demands not simply knowledge but also special gifts of a high order that are not ommonly found To discover such expositors and o give them full opportunity is of vital importance o the community to-day. This is not simply a matter of giving the expositor his due status, though hat could be one factor in encouraging the development of such gifts The linking of exposition and authority is perhaps one of the most important unctions of such a series of lectures as the Reith Lectures, and it is one to which universities could well give more thought in arranging their extramural lectures and in encouraging the production of uch works as Sir Walter Moberly suggested Nor is it matter for the universities alone professional nstitutions have their own responsibilities in promoting public understanding of the issues involved n the impact upon public affairs of the technologies with which such institutions may be concerned

The questions of professional discipline involved in he issue of exposition and authority, such as erminology or the relations between one discipline n technology and another, are only one facet of this roblem of communication and public understanding. Exposition and interpretation are conditioned also y the medium of communication involved, and we annot ignore the fact that the use of particular media or changes in political and social conditions may hinder the task of exposition or even make it npossible There are limits to the use of broad-asting, and the potentialities of television are largely nexplored At the same time there is real danger hat they, and particularly television, may be ncouraging an uncritical and unreflective passivity in listener and viewer that may also largely destroy the possibility of influencing them by the printed word

Quite apart from this danger of a new form of illiteracy, effective communication depends not only on the existence of competent expositors and interpreters, but also on the general level of education in the community. Education cannot be dismissed as something concerned solely with fitting the school-leaver for some particular occupation or vocation it is concerned first and foremost with enabling him to live wisely and intelligently in this age of science and technology. For that reason alone, the scientist or technologist has a special concern, as an ordinary citizen, with the standard of general education

There is a further reason why the scientist and technologist are specially concerned with this question of communication—with the problem of interpreting clearly and effectively to the whole community the implications of scientific progress for public policy. Unless there is public understanding as to what science is doing, and the conditions of scientific and technological advance, there is real danger both that adequate financial support will not be forthcoming and policies may be pursued which threaten particular fields of scientific endeavour, possibly of vital import for the public welfare, and the conduct of scientific or other creative activity. It is increasingly important for the specialist to take care over his terminology and bear in mind the needs, not only of his fellow specialists, but also of those other scientists and technologists with whom he may be called upon to co-operate, and he should also consider the problem of interpretation to the general community. Serious thought and a determined effort are required from scientist and layman alike to solve this problem of interpreting to the ordinary citizen what science is doing, the conditions essential for effective scientific work, and the relevance to national welfare of the work and results which to-day in increasing measure are supported by public funds

---

PREHISTORY OF AFRICA

The Prehistoric Cultures of the Horn of Africa

An Analysis of the Stone Age Cultural and Climatic Succession in the Somalilands and Eastern Parts of Abyssinia By Dr J D Clark (Occasional Publications of the Cambridge University Museum of Archæology and Ethnology—Vol 2.) Pp xx+386+52 plates (Cambridge At the University Press, 1954) 105*s* net

DR DESMOND CLARK, curator of the Museum at Livingstone, North Rhodesia, is already well known for his fine work on the banks of the Zambezi near the Victoria Falls and other sites in Northern Rhodesia He was good enough to welcome me there in 1948

In a series of short articles he has already revealed to us some discoveries he had made during his military service in Somaliland and Ethiopia during the Second World War His sojourn there was prolonged during another two and a half years (1941–46) and he has returned there since to complete certain researches

The author has used this work as a thesis for a doctorate at Cambridge He has studied more thoroughly than any other prehistorian this eastern horn of Africa, extending 2,500 miles both in length and breadth

After the usual and most useful physical, geographical and climatic descriptions of this immense region which shared in the violent tectonic phenomena forming the 'rifts' which upset the whole surface of East Africa, the author gives an account of the explorers preceding him Bourg de Bozas (1901), the Italians, Stefani, Paoli and Puccioni (1913–36), Cipriani (1927–32), Graziosi and Puccioni, and others, not forgetting the earlier ones, Seton Karr, Paulitschke and Winkenberg (1880–97) Dr Clark was also familiar with the work of Teilhard de Chardin, Paul Wernert and myself in 1933, both in the region around Obock (French Somaliland) and near Diré Dawa

Near Obock, Father Teilhard and I made the only study attempted so far of the 60- and 30-metre raised beaches of Somaliland. The author describes this in detail, but appears to me to exaggerate when he says the oldest industry is as late as what he calls Acheuleo-Levalloisian Personally, I think it far older, and likewise in the neighbourhood of Diré Dawa He does not mention a bi-faced tool which I think probably Abbevillian, which I picked up at Warka (Harrar), it is true that it was not in its original position, but I think it would be well worth while to search for its original site

Speaking of the extraordinary and abundant industry consisting of picks, found by Paul Wernert at the end of the Gulf of Tadjoura and near Lake Assal, which has not been found in any other place, the author does no more than mention it

Three very crowded chapters of 109 pages follow, on the Quaternary geology and stratigraphy of British Somaliland, the Danakil Rift and the north and east coasts Dr Clark devotes some pages to the problems of the successive sea-levels in the straits and discusses the possibility of an Arabo-Somali continental land-bridge. These pages contain a wealth of most valuable observations and information, a résumé of which is impossible, but their content is indispensable for any future explorer of these regions

After a very short chapter on prehistoric terminology, the author passes in review the different groups of industries represented, according to him, in the regions mentioned, first, Acheuleo-Levalloisian, then Levalloisian, the Stillbay cultures of Somaliland and the industries derived from the Magosian, Magosio-Doian, Hargeisan, then the Somaliland Wilton culture with the Neolithic and Strandlooper influence Every industry *in situ* (and there are a great many sites, some not very important) has its stratigraphy described, enabling the author to correlate them with the sequence of regional climatic conditions, and he gives a precise analysis of the types of chipping and weapons produced, which is quite satisfactory, though no doubt some of the attributions might be disputed It seems to me most improbable that nothing can be classified as older than Acheuleo-Levalloisian

A wealth of sufficiently good illustrations, banished to the end of the volume, enables one to identify the types described and may also suggest that this Old Palæolithic is rather too simplified. It is curious to note how it is concentrated around Obock and the region of British Somaliland Then comes the true Levallois, a long and monotonous stage, rightly related to the North African and Palestinian Levalloiso-Mousterian.

The Stillbay culture (Moustero-Solutrean) follows and is derived from the Levalloisian, as in all southern and tropical Africa Its chief characteristic is flaking, in which pointed triangular flakes predominate, or blades, the latter sometimes blunt-backed burins Stillbay is derived chromatically from Magosian, in which microlithic forms appear, giving place to several variations, one, the Doian, i markedly microlithic and had already been noted to Graziozi, who called it Eibian As for the Hargeisan facies distinguished by an abundance of blades and burins, always few in number in the other facies, the author attributes this to an influence coming from the north, which seems plausible The Doian industry is massed, rather curiously from a geographical point of view, between the two rivers Tana and Yuba Besides microliths, bi-faced arrow-heads with a concave base are found in it, and other types familiar in the Somaliland Wilton facies

Very few pages are devoted to the painted and engraved rocks (there are not many), which, nea Harrar, I had studied, in the Porcupine Cave a Dire Dawa and at Genda Biftou (Sourré) The autho adds some information on Lago Oda, where Wilton is found I am not as certain as he is that the schemati designs in the Porcupine Cave are not earlier than the semi-naturalistic ones at the other two sites I is, however, true that another stylized series seems to follow them, as the author remarks, but there i one point which must be noted, when attempting to judge the age of all these paintings: it is, that superposed on oxen with great horns of the type of those in Genda Biftou, at Lago Oda and other sites, there are splendid fat-tailed sheep. The date of their introduction into the country could, I think, easily be obtained, though this can wait so that there could be more evidence and certainty

My suggestion that it would be well to compar the animals painted with those of ancient Egypt, a well as the way the cows' udders were represented of which I had made a study, led me, though with a certain reserve, to consider they were related Th author seems rather favourable to this idea, though he appears to be astray in his date (the dawn of th Christian era), which seems to me excessively short

In the last pages of the book, Dr Clark attempt to establish a correlation between the industries and climatic phases and to compare the results obtaine with those in other regions in Africa and souther Arabia In short, this book is conscientious, instruc tive and will be extremely useful to future explorer of the country. H BREUIL

CONNECTIVE TISSUE

Connective Tissue in Health and Disease

Edited by Dr G Asboe-Hansen Pp 321+1 plate (Copenhagen Ejnar Munksgaard, 1954) 50 kronor 7 50 dollars

"AND, finally, owing to the difficulty of investigation, and a certain amount of wearines produced by unprofitable discussions, the connectiv tissues have recently been somewhat neglected b microscopists" Written by Heinrich Frey durin the latter half of the past century, these words coul have applied equally well to most of the years whic have passed between then and now. Although it wa known during the seventeenth century that parts of the body were fibrous in nature, the name 'connective tissue' was actually proposed by Johan Muller in 1830, and later Kolliker suggested as an alternative term, 'sustentacular tissue' Reichert organized the existing knowledge on this tissue in 1845, and Virchow demonstrated its importance in pathology n his famous work published in 1858 That the sole function of connective tissue in the normal animal was to act as scaffolding was the accepted view at the time of publication of Frey's work. The English translation (1874), in fact, says "Connective substance takes but little part in physiological occurrences of the mature and healthy body".

This view continued to be generally accepted until relatively recent times However, since the time of Virchow and the recognition of a variety of cells in connective tissue, it became obvious that it played an important part in inflammatory processes, and microscopical studies of wound healing demonstrated ts essential role in the formation of scar tissue, but the problem remained—what part does it play in the normal functioning of the body?

Its mechanical function is obvious, the supporting nature of the deep fascia in the preservation of form and contour and the facilitation of muscular attachment and movement are known to every student of anatomy Modern techniques have added substantially to our knowledge of connective tissue The complex cross-striation of collagen fibres is well known and so too are the presence of hyaluronic acid and chondroitin sulphuric acid in the ground substance. The water-binding ability of the ground substance and its role in œdema are also recognized

The ground substance is the link between the blood vessels carrying oxygen and nutriment and the organs and tissues which require them. Its molecular organization appears to be adapted to facilitate the rapid diffusion of such substances. The adventitia of many blood vessels is, in fact, impregnated with phosphatases, suggesting that it may be acting as a broad membrane with selective control of the substances which pass through it—a suggestion which s supported by the presence of phosphatases in the endothelial cells of the capillaries. In 1924, Hojer demonstrated the dependence of the connective tissues upon adequate supplies of vitamin C, this in the following twenty-five years resulted in a series of papers emphasizing the importance of this vitamin n fibre production and the development of scar tissue in wound healing.

More recently, in 1949, Hench and his colleagues showed that the pituitary, acting through the adrenal, by the medium of adrenocorticotrophic hormone exercised control over connective tissue Cortisone, in fact, was found to depress fibre production in inflammatory conditions This work has stimulated further interest n a tissue which was already gathering in importance, and as the full battery of modern techniques becomes turned upon it, may be expected to yield still more of its secrets and to demonstrate still further its fundamental functions in health and disease

In Asboe Hansen's "Connective Tissue" we have a series of chapters by experts which deal with a wide variety of aspects of the subject. They are, as the editor says, pioneers of modern connective tissue research and their contributions are worth reading from this point of view alone The subjects covered range from morphology and chemistry of the collagen fibres and the ground substance, through the effects of hormones, disease and ageing upon connective tissue in general, to a consideration of its relation to collagen diseases, arthritis, arteriosclerosis, ophthalmology, and cancer. There are many gaps, for example, there is no proper consideration of the elastic fibres although they are referred to in a more or less desultory fashion in some of the chapters. The effects of cortisone and of vitamin C deficiency also receive a cursory treatment. There is no doubt that everyone who has an interest in connective tissue must read this book, but it must be appreciated that it is not a comprehensive work, and the individual chapters do not deal exhaustively with the subjects they discuss The book is, in fact, fundamentally a collection of essays on selected topics related to connective tissue. Its value, however, is greatly reduced by the unforgivable lack of an index

G. H. BOURNE

GEOLOGICAL HISTORY OF CALIFORNIA

Earth Song

A Prologue to History. By Charles L. Camp Pp. xi+127 (Berkeley and Los Angeles University of California Press, London Cambridge University Press, 1952.) 37*s*. 6*d*. net

THE title of this book gives at the first glance little indication of its merit or, indeed, of its scope, and only those who know the author or his other works will realize the import of the song. This is, in fact, a geological history of the State of California with a general account of the life and the reconstructed appearance of some of its former inhabitants during some five hundred million years

It may therefore be thought that it is just another American palæontological book. In some ways it is, with all the wealth of illustration and of interest that such books present But California has a separate history, and at least one of its geological deposits, that of Rancho la Brea with its asphalt trap, is unique. Dr. Camp gives an account of the Californian rocks and deals, period by period, with the life of the early sea, the conquest of the land, and the rise of amphibians and reptiles, leading to the ampler record of the mammals. The whole is embellished by a fine series of pencil drawings by William Gordon Huff, and these are worthy of inspection for their intrinsic interest as well as for the fact that new and authoritative reconstructions of vertebrate fossils always have a great appeal The book also deals with the rise of man in a general way, since there is a regrettable deficiency of fossil men in this Golden State, but goes on to the description of the early Red men and the Folsom implements. There are excellent maps and charts from the pen of Owen J Poe and a number of the charts deal with the chronology Some of these are of considerable value, since the correlation of the delightful-sounding Californian formational and later chronological names with European counterparts or quasi-equivalents is difficult The book contains a glossary, a very useful list of references, and an index There are introductory passages to the chapters in a rather poetic American style, but on the whole the text is excellent and informative and the book should certainly find a place in major reference and university libraries.

W. E. SWINTON

INSTABILITY OF THE EARTH'S AXIS OF ROTATION

By T. GOLD

Royal Greenwich Observatory, Herstmonceux Castle, Sussex

THE axis of rotation of the earth undergoes certain changes of direction, some of which are the results of known causes, whereas others are not yet understood. The major movement is the precession, whereby the axis of the geoidal figure of the earth together with the vector of the angular velocity and that of the angular momentum sweep out a cone of 23° once in twenty-six thousand years. One effect of this is that the year as defined by the seasons is different by one part in twenty-six thousand from the year as defined by the earth's position on its orbit. The precession is due to the motion of the spinning earth under the action of an external couple, namely the gravitational couple exerted by the sun and the moon upon the non-spherical earth. That couple depends on the relative position of these objects and is therefore not steady in time. The result is a superimposed wobble in the direction of the axis of rotation, and it has been given the name of 'nutation'.

There exist, however, other effects not produced by external couples but by a redistribution of matter or angular momentum on or within the earth. They are movements whereby the direction of the axis of rotation remains nearly fixed in space, while the earth itself moves relative to it. The absolute angle by which the axis of rotation moves is some three or four hundred times smaller than the movement of the earth, and it is therefore only the latter which is a measurable effect, usually noted as a variation in the apparent latitude of observation points on the surface of the earth. The angle involved is small, of the order of $\frac{1}{4}''$, the motion is complicated and irregular, but two components can be recognized, one of a period of one year and one of a period of fourteen months.

These movements of the earth relative to its axis are of great significance to theoretical work on geophysics. While the other motions are accurately described by the rigid-body dynamics of the system, this one has its origin, period and damping related to physical conditions on or in the earth. The annual term is thought to have its origin in atmospheric effects[1,2]. The origin of the excitation of the fourteen monthly motion is unknown, but it is understood that the period is the one corresponding to the 'free' or 'Eulerian' nutation. That period is given for a rigid body by $\left(\frac{A}{C-A}\right)T$, where A, A, C are the principal moments of inertia and T is the rotation period. This value would be 305 days for the earth, but a very modest amount of elastic deformation would lengthen it to the observed 420 days. The mean Young's modulus of the earth has to be of the same order as that of steel for the period to suffer as little lengthening due to the deformation[1].

The question of the excitation and the damping of the motion is more difficult to treat. There is no clear-cut way of distinguishing the component of the motion which corresponds to the unknown excitation from that which corresponds to the decay due to internal damping. It can, however, be inferred, o the assumption that the excitation possesses no consistency, that the damping time must be fairly shor and cannot be more than a few periods, ten at th most, for a decay to $1/e$ of the original amplitude i the absence of further excitation. Alone the actua amplitude of the motion, together with an estimat of the excitation taken from just those occasion when the amplitude suffered an increase, puts a limi of this order on the damping time; with lesse damping the amplitude would be expected to b greater according to the statistical addition o exciting impulses. (Jeffreys quotes an estimate o fifteen years; Walker and Young, recently, one o three years[3].)

Where does this high damping arise? The requirement is for some relative motion to occur in whic energy can be dissipated. But the obvious places o the surface, such as the atmosphere and the oceans cannot be responsible, for the material that move relative to the solid part of the earth requires to hav more than a certain moment of inertia in order to b able to cause the damping at all; and it then require to be coupled in a suitably dissipative way to th solid part of the earth. The moment of inertia o the atmosphere and oceans is insufficient. The liqui core of the earth has been discussed as a possibl source of the damping, but its small moment of inerti (10 or 12 per cent of the whole) can be shown to rul it out, too[4].

The large damping must then arise from a dissipative deformation of the solid part of the earth. The existence of a high Young's modulus is no guide to the plastic flow that may occur in the material, or to the relation between the flow and the stress. It is difficult to see in what other way this lack of permanent stiffness could be measured. The damping of earthquakes is scarcely relevant, as it is concerned with periods 10^8 times shorter. The solid-body tides of the earth are concerned with a period a thousand times shorter than the nutation, and even there the presence of a small amount of dissipation would escape detection.

The existence of gravity anomalies over large regions is sometimes taken as an indication of long-term stiffness down to a depth of at least a few hundred kilometres. Such gravity anomalies are related to long-lived tectonic features and are therefore quite reasonably inferred to be long-lived themselves. But on the other hand, the bulk of the materials on the surface of the earth—the continents, the mountains—are not supported by substantial non-hydrostatic forces from depths below a hundred kilometres. If the occurrence of permanent stiffness down to great depths much below a hundred kilometres were a world-wide phenomenon, then it would be a matter for surprise to find that all the major deformations of the crust that have occurred have managed only so rarely to pile material up on an underlying stiff base to produce a very large gravity anomaly. The information obtained from gravity surveys therefore suggests that, except for a few areas, there is no appreciable permanent stiffness below about a hundred kilometres. Stiffness in some localities is, of course, not decisive for the behaviour of the wobbling earth.

Another line of argument also suggests the absence of permanent stiffness of the main geoidal shape of the earth. At present the solid part of the earth is very nearly the equilibrium shape appropriate to the present speed of rotation. Any severe departure either way from this shape would show itself very simply: the oceans which take up the equilibrium shape instantly would then dominate either at the poles or in equatorial regions. In fact, the distribution of land and water shows no significant tendency of such a type. On the other hand, the earth's speed of rotation is believed to have changed significantly n geological time. It has been changed either by giving up angular momentum to the moon through the agency of tidal friction—and the moon shows signs of a tidal bulge appropriate to a greater proxmity to the earth—or the speed of rotation may be determined by the resonance with atmospheric tides, n which case it must have changed substantially with changes in the structure of the atmosphere[5].

There exist many forms of non-elastic behaviour of solids other than plastic flow, and all of them lead o dissipation of energy in a stress cycle. “Elastic after working”, for example, has been mentioned by Jeffreys in this context[1]. Plastic flow is, however, the simplest type of behaviour, and it occurs in most solids in the vicinity of the melting point. It is a behaviour in which there is no ‘memory’ in he material, the instantaneous stress defining the nstantaneous elastic strain and the instantaneous ate of flow. There seems to be no case for invoking any of the more complicated types of behaviour in which the material possesses a ‘memory’ determining ts reaction to a stress, such as is often the case with materials composed of large and complicated molecules. Also plastic flow must in any event be invoked o account for the absence of long-term rigidity which has been inferred from other considerations.

The speed of plastic flow can now be deduced on the basis of the assumption that the damping of the ree nutation arises entirely from this cause, and that he characteristic time is ten periods. If there were an angular separation between the axis of figure and he axis of rotation, then the plastic flow would be uch as to allow the figure to become deformed and ence its axis of symmetry to move. In the absence f other effects, the axis of symmetry would then pproach the axis of rotation by ten per cent of their ngular separation in each period of fourteen months. or the motion of nutation itself this plasticity would esult in dissipation only, but other motions with ow secular effects are made possible.

The long-term stability of the axis must then be onsidered. A spinning sphere would possess no tability of its axis of rotation at all, the smallest eetle walking over it would be able to change the xis of rotation relative to markings on the sphere y an arbitrarily large angle, the axis of rotation in pace would change by a small angle only. What tability the earth's axis possesses against movement elative to the solid earth is derived from the geoidal hape, implying that it is spinning around the rincipal axis of inertia of greatest moment and ence possessing less kinetic energy than if it spun ith the same angular momentum around any other xis. This complete stability against a secular change therefore dependent upon the stability of the hape. If, as a result of a slight redistribution of mass, the instantaneous axis of rotation were to be moved by a small angle (such as is the case in the free nutation) then, if there is plastic flow, the axis of figure would slowly follow. For example, let us consider a redistribution of mass the dynamical effects of which are the same as those of an excess mass situated somewhere neither at the equator nor at the pole. The damping will assure that the initial wobble is stabilized to a spin around the new principal axis. But so long as there exists the excess mass at one place, the axis of the geoidal shape cannot be also a principal axis. Therefore, as the geoidal shape alters so as to become adjusted to the new axis of rotation, so the axis of rotation moves on. The magnitude and the angle of latitude of the excess mass define, in fact, not simply an angle of displacement of the earth's axis relative to the solid surface; they define an angle between the instantaneous axis of rotation and the axis of the geoid. The magnitude of this angle in turn defines the stress and hence the rate of flow altering the shape, given by the constants of plasticity of the earth. The resulting rate of flow gives the rate at which the axis of the geoid moves relative to markings on the earth, and that is now also the rate at which the rotational axis moves relative to the earth, though, of course, remaining nearly fixed in space. It is as with the ass and the carrot hanging from a stick held by the rider, to be more precise, as if the ass would run faster the farther the carrot was held in front of his nose. But how far can the ass be made to run by this method?

In the movement of the earth the latitude and the excess mass were decisive. The angle between the two axes and therefore the rate of polar wander will be greatest for an excess mass at a latitude of 45°, and there will be no position reached in the motion where the angle vanishes until the axes have swung around so as to make the new equator go through the position of the excess mass. The angle α between the axis of figure and the axis of rotation is proportional to $M \sin\theta \cos\theta$, where M is the excess mass and θ its latitude. The rate of deformation and hence of polar wander must increase with increasing α, but the actual relation between the quantities depends upon the details of the non-elastic properties of the material. The rate of plastic flow as well as other departures from elasticity generally increase with increasing stress faster than in proportion to the stress. If, therefore, the long-term effects were connected with the occurrence from time to time of larger angles α than can be seen in the free nutation at present, one would merely be under-estimating the amount of plastic flow if one assumed the rate to be proportional to α and given by the damping of the free nutation. The distance to which the wander will proceed is independent of M; it is simply the angle θ. One has here the situation of a secular instability where a small disturbance does not produce a small effect but where it produces a large effect slowly.

Sir George Darwin considered a motion of that sort[6] and described it qualitatively, but in summing up he considered it unlikely that the motion had, in fact, been taking place, for he would have expected it to have resulted in a change of the distribution of land and water. Geologists, however, had assured him of the permanence of the oceans. Due to the new knowledge of isostasy, this argument has by now lost all force. In the case of perfect isostasy, an ocean basin would be characterized by the occurrence of a region of greater average density below the ocean floor. The depth of any point of the basin below a certain equipotential surface such as the sea-level would be given solely by the local distribution of density, and would therefore be unaffected by a change of the geoidal shape to a new axis. The actual isostatic compensation is not perfect; but still it is known that there is a considerable degree of correspondence between the heights of the surface and the densities below it. In so far as that is true, the distribution of oceans and continents would remain unaffected by polar wander. The details of the nutation were also not available to Darwin, and the case for plastic flow was therefore weaker and lacking a quantitative estimate.

The dynamics of the problem do not introduce any long time constants, and the speed of polar wander must be entirely dictated by the rate of plastic flow. With the plasticity derived from the damping of the free nutation, we can make an estimate of the speeds involved; for the rate of movement of the axis of figure would have to be one-tenth of the angle α, or more, per annum. If a continent of the size of South America were suddenly raised by 30 metres, an angle of separation of the two axes of the order of one-hundredth of a degree would result. The plastic flow would then amount to a movement of one-thousandth of a degree per annum. The earth would hence topple over at a rate of one degree per thousand years or by a large angle in about 10^5 years. The order of magnitude of the speed of this process would therefore be preserved if the raising of a continent by 30 metres occurred not suddenly but in a time of the order of 10^5 years. This rate is perhaps higher than could be expected. A continent of that size does not rise perhaps at such a rate; and the observed degree of isostasy on the earth suggests that the rise of a mass is associated with such a redistribution of material that the actual increase of moment (in the sense of the excess mass discussed before) is very much less than corresponds to the elevation of the surface. As in this discussion the rate of tipping is proportional to the square root of the rate of elevation of mass, the estimate will not be as rough as the geological data must necessarily be. A rate of elevation of the continent by three metres in 10^6 years is certainly a low figure and would result in a time of 10^6 years for a large-angle change in the orientation of the earth relative to its axis of rotation.

This, then, is the possible effect using the plasticity suggested by the nutation. But what motion must we then expect in geological times, when there are constantly variations in the distribution of masses? It is perhaps easiest to consider this with the aid of a model of the earth which, though it may be false in other respects, possesses just the bare features required for these dynamical processes. That model would consist of a plastic spheroid representing all the earth below a hundred kilometres depth, of such plasticity that no forces of hydrostatic disequilibrium can be upheld there. On it there is floating a crust consisting of a close mosaic of pieces of different densities. This model would possess different values of the moments of inertia about different axes of rotation. Though in each case the interior will become the appropriate spheroid, the non-uniform crust will be in a different relation to it; and the blocks of the crust made of lighter materials will make a greater contribution to the moment of inertia at each latitude than the heavier ones, as they represent the same quantity of material, but at a greater distance from the axis. The secular instability that we have discussed is such as to rotate this body relative to the axis of rotation until its spin is around the axis of the greatest possible moment of inertia. Movements of material on the surface of the earth correspond to changes in the masses and mean densities of the blocks. It wil therefore occur from time to time that a new distribution arises that would produce a greater moment of inertia for the body if it spun around another axis. Whether this situation must now be expected to produce a secular motion whereby the axis is continuously hunting the direction of the greatest possible moment of inertia is not immediately clear; for the movement of the axis in turn causes certain redistributions of masses of air and water, and those may be in such a sense as to help or to hinder the movement. Possibly the most important effect of that sort is circumpolar glaciation producing large and rapid variations of mass at latitudes not so far from 45°, where the dynamical effect would be a maximum, and altering the sea-level everywhere also in intermediate latitudes. In considering the small present-day movements of the axis, Munk and Revelle[7] came to a similar conclusion and stated that the pole should be expected to move towards the location at which most ice is melting at present.

It may be, then, that instead of a passive stability of the pole due to stiffness of the shape of the earth there is merely from time to time a stability arising from a feed-back process that balances out sligh asymmetries that arise. If indeed glaciation is the dominant effect then, for example, the pole situated in a circular ocean extending over some 20° o latitude would tend to be in a stable position. Any departure of the pole from the centre of that ocean would cause glaciation on the land towards which i had moved (the ice floating on the water has n significant dynamical consequence), and such an addition of mass in that locality would act in the sense of pushing the pole away from that land. From the work of Jeffreys[1], Mintz and Munk[2] and others it is clear that atmospheric effects may also contribute to such mechanisms.

The movements of the pole relative to the surface of the earth that have been measured in the past fifty years do not amount to much. If an estimate is mad of the centre of the curves of travel of the North pole during the nutations, then it appears that thi centre may have been drifting by something of th order of 0.1″ in the direction of Newfoundland in th past fifty years (corresponding reasonably well to th continued melting of Greenland ice)[7–9]. Such a rat of movement, even if it continued in the sam direction, would thus take about 2 × 10^8 years t turn the earth over by 90°. There is also othe evidence in past geological epochs for long intervals of the order of fifty million years, of no drasti climatic change. On the other hand, there is ampl evidence that drastic changes of climate have occurre occasionally in geological time, and such change have served geologists for the division of time int geological epochs. It is thus tempting to sugges that there have been just a few occasions when th axis has been 'free' and has swung around as rapidl as would be given by the stiffness of the earth an the rates of tectonic movement, leading to a time scale of the order of 10^5 or 10^6 years, but scarcel longer. But then in its rapid movement it ha encountered a trap where it was caught within small angle by the shifts in masses which its move ment itself induced. It must then have remaine in that neighbourhood until either there was a sufficient tectonic change to lead to an unbalance greater than could be compensated by glaciation or atmospheric effects, or until the distribution of land and water had been so modified as to destroy the mechanism of the trap. There would then have followed another period of hunting until a new trap became operative The recent observations of fossil magnetism of rocks and sediments show such great promise that we can expect before long to have a good indication of the movements of the pole that have, in fact, occurred in geological history It is known already that a movement of at least some regions relative to the position of the pole is indicated by the results, and this constitutes a further item of observation along with such geological items as the glaciation of now tropical zones, that force geophysicists to consider that either continental drift or polar movement must have occurred on a substantial scale. In due course the magnetic data will make the distinction between the two The occurrence of continental drift over great distances would imply new and surprising data about the construction of the earth and in particular its crust, while the occurrence of wandering of the poles over great distances would fit in well with all that is known about the earth, and would reaffirm what can already be inferred from other data.

SCIENTIFIC INTELLIGENCE AND DEFENCE

By CHAPMAN PINCHER

SCIENTISTS in Britain are to play a much bigger part in Intelligence work as a result of recent changes effected by the Defence Ministry *Ad hoc* panels of scientists and technologists expert on particular matters are to be set up to help in the nterpretation and collation of certain kinds of nformation collected through Intelligence sources

These scientists will be drawn from the universities and from industry as well as from Government stablishments After security clearance they will be asked to assist in the analysis of information about oreign weapons, equipments and defence potentialities

Since the War, responsibility for this type of work has rested nominally with the rather small Directorate of Scientific Intelligence in the Defence Ministry That arrangement has proved to be impracticable The Fighting Services have become so technical that it is no longer possible to draw a line between the outine Intelligence work for which they should be held responsible and scientific Intelligence In fact, ntelligence chiefs have despaired of defining scientific ntelligence except in the general terms that it is the knowledge and appraisal by scientific methods of oreign developments in science and technology

The Directorate of Scientific Intelligence has therefore ceased to exist as a separate unit. It has been absorbed into the Joint Intelligence Bureau, which, though still retaining its name, has been given much wider functions

The Joint Intelligence Bureau will henceforth serve as a central Intelligence agency to which a wide range of strategic Intelligence information will be transmitted Its staff will be responsible for ensuring that the utmost possible use is made of such information.

This change brings the British system more closely into line with the Intelligence methods adopted by the United States Government after the War. The failure to appreciate the imminence of the Japanese attack on the American Fleet at Pearl Harbour was later attributed to defects in the higher levels of the Intelligence system. Information clearly pointing to the attack and its approximate date was available in the various separate Intelligence agencies, but because there was no central authority it had never been properly 'appreciated' and had not been put forward at the levels where decisions are made. The U S Central Intelligence Agency, now headed by Mr Allen Dulles, brother of Secretary of State John Foster Dulles, was therefore set up to ensure proper utilization of Intelligence information in the future. Its necessity has been enhanced by the growing danger of the possibly decisive influence in future wars of 'Atomic Pearl Harbours' All Intelligence information from the Fighting Services, the Secret Service and the Atomic Energy Commission is now canalized to the U S Central Intelligence Agency.

The British reorganization has left the Fighting Services responsible for their own operational Intelligence work—an arrangement which is thought to be more flexible as it leaves the Services less isolated from the central agency. It is believed that the people who interpret scientific Intelligence will be more effective if they retain closer connexion with the Service in which they themselves are most expert

Major-General Sir Kenneth Strong, former chief of the Joint Intelligence Bureau, remains head of the enlarged organization Mr H S. Young, who has been acting director of scientific Intelligence since the resignation of Prof R. V Jones from that post last year, has been appointed a deputy director of the Joint Intelligence Bureau

After collation by the Bureau, matters of importance will be put forward to the Joint Intelligence Committee, a high-level group which includes the heads of all the Intelligence agencies and a Foreign Office representative. This committee will produce a 'considered view' on the matters in hand and make it available to Service commanders, ministers, senior Civil servants, ambassadors and others who need it

The enlarged Joint Intelligence Bureau is responsible to the Defence Minister, Mr Harold Macmillan, who has a direct voice in the Cabinet. As an additional link with the Joint Intelligence Committee and the Intelligence chiefs, a post of Scientific Adviser on Intelligence to the Defence Minister has been created as part of the new arrangements Mr E C Williams, formerly director of operational research in the Admiralty, has been appointed to it

Though these changes have been made entirely on the basis of British experience, it is believed they will cause satisfaction in Washington—an important consideration, as fears about British security have held up interchange of information on atomic weapons and other defence developments.

OBITUARIES

Sir Edward Mellanby, G.B.E., K.C.B., F.R.S.

STATESMAN for a quarter of a century, scientist for half a century one feels in preparing this notice as Mellanby himself said he felt when faced with the preparation of the Hopkins Memorial Lecture, that the task requires a "degree of knowledge, skill, judgement and sympathy . almost unattainable"[1].

Sir Edward left the stamp of his skill as a statesman on the work of the Medical Research Council, of which he was secretary for sixteen years The present members of the Medical Research Council have in the following words recorded "their high appreciation of his great services to medical science As Secretary of the Council from 1933 to 1949, after being a Member since 1931, Sir Edward Mellanby took the leading part in the difficult tasks of deploying the Council's scientific resources in support of the national effort during the second world war and of reconstructing and notably expanding the organisation thereafter. To these responsibilities he brought an intense regard for scientific truth, a wide knowledge and deep understanding of medical problems, a sure sense of what was important in research, and a constant desire to encourage all who showed ability as investigators and ideas likely to lead to real discovery His endeavours had great success"[2].

It has been said that he was in some ways "not well cast as an administrator"[3], but he brought to this highly responsible post the qualities of a statesman—sagacity, far-sightedness and skill in the management of practical affairs—in unusual measure, he deputed to the professional administrator those matters which could safely be entrusted to him. It was characteristic that on one occasion he denied that the Council had a policy in financing research workers except "to find the right men and back them in every way possible"[4]. He often said that the recruitment of first-class administrators was an easy matter compared with securing men of the best type for medical research, such men are, he said, "limited in number, and cannot be appreciably increased by any known method They must in general be what is known as clever men, but cleverness alone accounts for little. In addition, they must be men of strong character, capable of hard and often disheartening work, with power to distinguish truth from falsehood, prepared to spend their lives with limited social contacts and to forego riches" Such men, he recognized, are rare, and he considered that one aspect of the Council's work was, short of this ideal, "to attract able men, and by providing financial assistance and ensuring the proper kind of training, helping them to a career of medical research"[5] While he stoutly maintained that the supply of the right type of man was the basis of success in medical research, he defined the main function of the Medical Research Council as the promotion of "scientific investigations for the acquisition of knowledge likely to be of value for the prevention, diagnosis, and treatment of disease, and for the maintenance of normal health and full human efficiency"[6]

On the many occasions when he gave important named lectures he drove home with telling examples the benefits to mankind in the past hundred years of the application of the discoveries in medical science It is fifteen years ago since he opened his Rede Lecture with the words "Probably at no time in the world's history has the average citizen of this and most other civilized communities felt so insecure against death by violence At no time in the world's history has the same citizen had reason to feel so secure against death by disease" Concluding this Lecture, he claimed that "medical science and its instrument, medical research, have indeed justified themselves For every problem—social and economic . the only solution is more knowledge and more wisdom to use this knowledge There is no limit to the amount of knowledge to be gained, if the medical scientist is given the opportunities and facilities for his work. Would that the same could be said about the wisdom necessary to make the best use of this knowledge !"[7].

One principle that he returned to time and again was the difference in effectiveness in research of the experimental method over observation "Where", he said, quoting Lord Moulton, "we are reduced to observation, science crawls Where and in proportion as you can use experiment, science advances rapidly"[5] He recognized, however, "the enormous difficulties of the experimental method in biological investigation due to the complexity of the inter-acting materials"[8] "Long experience has taught me", he said in his Harveian Oration, "that it is seldom in the facts of discovery, but rather in the interpretation, especially the first interpretation, that mistakes are made"[4].

In his personal work, Mellanby considered himself fortunate to have come as a medical student in 1902 in the scientific care of Hopkins, in whose laboratory he later spent two years (1905–7) as a research worker. Mellanby published his first paper in the *Journal of Physiology* in 1908 on creatine and creatinine Even at this time he had begun to pry into the effects of disease, in this case liver damage carcinoma and other conditions likely to affect creatine metabolism, and his broad biological interest was also already manifest in that he examined the creatine content of various animals and its occurrence in the course of development of several of these in an attempt to discover whether from ontogeny and phylogeny light might be cast on the evolution o vertebrate animals An incidental observation in th course of this work—that creatine is destroyed by bacterial action—led him in later papers to examin the problem of the effects of the bacteria from th alimentary canal on various substances One outcome of this work was the discovery that an organism in the alimentary canal could convert histidine into histamine, a substance now of great biologica importance He continued the study of creatine with reference to the metabolism of lactating women which was the subject of his first communication—presented by Hopkins—to the Royal Society early in 1913. Next he published the results of an attemp to discover the relationship between the formation and absorption of histamine and diarrhœa and vomiting in infants[9]. Thus there was already evidence of his interest in the interaction between clinical and experimental work in the laboratory, th theme of a book published in 1934, "Nutrition and Disease", based on the Croonian Lectures delivered to the Royal College of Physicians in 1933 By 191 he had begun to publish the results of his investigations on the production of experimental rickets This investigation arose out of a plan drawn up by the original Medical Research Committee in 1913 Rickets was included in a list of major disabling diseases besetting Great Britain at that time Mellanby was asked to investigate the part processe of oxidation might play in the etiology of the disease is experiments soon demonstrated that serious bone bnormalities result from faulty diet, and this riented the work towards the hypothesis that the iet might well be a primary factor in the etiology f the disease From that time onwards investigations ecame more and more along dietetic and nutritional nes, as seen in "A Story of Nutritional Research", is Abraham Flexner Lectures published in 1950[10] ne result of this work is that whereas at one time stunted children with bandy legs were so common s either to pass unnoticed or be a source of amusement", nowadays if we saw them "we would be ngry, because we would realise they were the roducts of ignorance or negligence"[8]

It was his involvement in this investigation of ickets that decided Mellanby not to return to Camridge when invited to by Hopkins when the latter ecame, in 1920, the first professor of biochemistry at ambridge It was, he has said, a crucial decision and robably a wrong one, and hereafter he felt he could o longer be regarded as a biochemist By this time he index to his publications had been once through he alphabet, before his death the alphabet was to e exhausted more than twice again

There is space here to deal with only a few of the main themes of Mellanby's research since that time ne was the presence in food of substances having pecific harmful effects, an inquiry which arose out f the work on effects of cereals on bones Evidence vas obtained of the presence in some foods of an nti-calcifying substance, later identified as phytic cid[10]. There was, he demonstrated, antagonism etween phytate and vitamin D, the former trying to xpel calcium from the body, the latter promoting its bsorption and retention. This anti-calcifying factor e included in a group of substances which he called oxamins, now more widely known as anti-metabolites.

Running almost in parallel with the work on the ardening of bones was his study of the shaping and nodelling of bones—work which began with an bservation made in the study of rickets that in itamin A-deficient animals damage to the nerves of he animal occurred, with the development of severe taxia and loss of sensation of various kinds resulting n deafness, blindness and anosmia Mellanby was ltimately able to show that, in his own words, these two inseparables, vitamins A and D, the avid and Jonathan of nutrition, whose faithful lliance in distribution and similarity of many hemical and physical properties has caused so much ouble to hosts of physiologists, biochemists and ther scientists, work in harmony and on the same ructures at the time of their active careers in the nimal body Although their functions are different, ney unite in directing and controlling the building up nd maintenance of bone structure"[10] Despite the owth of knowledge of the effect of vitamin A on the ody to which he had largely contributed, Mellanby ontinued to be dissatisfied because so little was nown about the site and the mechanism of its action e determined to examine the direct effect of the itamin on the tissue by tissue-culture techniques, nd after preliminary exploration of the problem he ought the collaboration of Dr Honor Fell They ound among a number of other interesting results ne exciting effect on tissues of plasma with a high itamin A content, namely, that chick ectoderm evelops not into normal skin, but into more highly eveloped mucus-secreting ciliated respiratory pithelium Returned to normal plasma, such tissue everts to normal skin Likewise in culture in high vitamin A plasma, corneal epithelium becomes hyperplastic, like the conjunctiva Clearly, since metaplasia is most prominently seen in cancer, this discovery has a bearing on this outstanding unsolved medical problem. He also thought that a similar type of approach may well be rewarded in the study of other unsolved problems of disease involving degenerative and other structural changes due to altered metabolism

Another recent discovery, and again an extension of earlier research, is the experimental proof that agenized flour is toxic to dogs and other animals The substance formed by the action of agene (nitrogen trichloride) on a wheat protein has been identified as methionine sulphoximine The mechanism of the biological action of this substance is still unknown. This discovery has had far-reaching effects in emphasizing the need for attention to be given to the effects of the chemical manipulation of food Recently steps have been taken to secure international action in this field. Commenting in his Sanderson-Wells Lecture on the increased incidence in the past fifty years of certain morbid conditions, Mellanby said that he found it "difficult to avoid the conclusion that some at least of these increases in disease are due to errors in living recently introduced or greatly expanded in modern times", and that the effects of chemical manipulation of foods provide "at least a subject worthy of enquiry" and one which "might well be considered whenever a disease commonly found in countries which use these methods has resisted all efforts of the investigator to find a satisfactory ætiological basis"[11]

These examples by no means exhaust the topics of Mellanby's published researches, which also include studies on alcoholism and disease of the thyroid gland, ergotism, the metabolism and transmission of cancer, the control of infections, especially puerperal sepsis and maternal mortality Nor does it include new probings into some major problems in disease which were in hand at the time of his death His declared aim was to open up new fields of research, especially of a physiological nature. This was a deliberate attempt to secure relatively more attention for biological objectives in research He restricted his own interests in the biochemical and chemical aspects of problems he was studying, as he felt that biochemistry was developing rapidly into a special branch of chemistry only too rarely with any direct relation to biological function

In his book, "Nutrition and Disease"[12], Sir Edward had outlined a plan for combining research in the clinical and laboratory fields, his success in applying his plan on a national scale will, it is hoped, be evident from the foregoing incomplete survey His success is the more remarkable when it is realized that not only was there a substantial volume of peace-time research initiated and sponsored by the Medical Research Council, but also an enormously increased activity on numerous war-time problems in civilian matters and in all branches of the Fighting Services The last two reports of the Medical Research Council published while Sir Edward Mellanby was still its secretary contain admirable accounts of these activities

In nutrition, Mellanby's chosen field of special interest and research, he early achieved international prominence, and in the early 'thirties he was made chairman of the League of Nations International Technical Commission on Nutrition He was an active member of the Accessory Food Factors Committee of the Medical Research Council since its inception and its chairman for many years. He contributed in this and other ways to the improvement of health through better nutrition. As a member of the Scientific Food Policy Committee of the War Cabinet and later of the Chief Medical Officer's Committee of the Ministry of Health, he exercised a powerful influence on the medical aspects of food policy in Great Britain. As chairman of the Food Rationing (Special Diets) Advisory Committee he took an important part in the difficult task of deciding how war-time rations should be modified or supplemented for persons with certain diseases

Research abroad owes much to his influence, and in recent years he visited Africa, India, Australia and New Zealand for the express purpose of advising on research Earlier he had been to Canada and on other occasions to the United States In all these countries he had many friends. He took an active interest in the work of the British Council and was chairman of the advisory Medical Panel from its formation in 1942, and he gave unstinting help and encouragement to the Council's medical work, his interest in the *British Medical Bulletin* never flagged, and it was his abiding concern to ensure that this journal conformed to its main purpose of presenting to overseas readers the many aspects of medical research in which British workers have excelled For many years he was active in the development of medical research in Colonial territories and was chairman of the Colonial Medical Research Committee Not only did he recognize the great need for the application of medical science, but he also foresaw what has only recently been widely recognized as a major problem, namely, the need for relating the rapidly increasing population to the supply of sufficient food He insisted that "most of the political, social and economic difficulties in tropical countries are, and will continue to be, biological in nature, and the sooner this fact is recognized the sooner will these difficulties be controlled or dispersed . . . and we can only pray," he said, "that there is sufficient wisdom left among us to use the fruits of science properly"[7]

Those who have known Sir Edward Mellanby and his work can easily add further tributes from their knowledge of other contributions of this great man to the quantity and quality of the life and living of mankind The illustrations given speak, out of his own mind, of the man, his work, character, ideals and objectives in ways which need no elucidation, indeed, any attempt to do so would be unjustifiable presumption It is a sign of his influence and calibre that those who knew him best are united in their profound respect and affection for him Our appreciation of the contribution of his constant partner, Lady Mellanby, must be one of gratitude, and we trust that she, with us, will find comfort in contemplation of his magnificent record of achievement

B S Platt

Prof. J. K. Parnas

News has been received recently of the death o J K. Parnas, formerly professor of physiologica chemistry in the University of Lwów (Lemberg) known internationally for his fundamental researche in the biochemistry of muscle

Jakób Karol Parnas was born in Eastern Polan on January 17, 1884, and as a boy was educated i Lwów He then entered upon an academic career a a student of chemistry, at the Technische Hochschul of Berlin-Charlottenburg In 1905 he joined th laboratory of Richard Willstatter in Zurich, where a a subject for his Ph D. dissertation he was allotte the tedious task of preparing the so-called third (o 'amphi') naphthoquinone It was much to the pupil' credit, and to his teacher's delight, when two year later, after numerous trials with a wide range o metallic oxides, he succeeded in preparing th crystals of this long-sought-after labile compound Years later this achievement brought him war praise from Willstatter, who in his autobiograph records also the accident which occurred in th course of Parnas's experiments, when a preparatio of gold oxide freshly removed from the desiccato exploded in contact with a spatula, and countles particles of gold became lodged in the young experimenter's eye. Although some of the larger particle were removed surgically, smaller ones stayed in th cornea permanently, fortunately without discomfor to the bearer, who in his later years was ever read to exhibit them to his students and accompany thi with a suitable reference to the physiological inertnes of gold as a 'noble' metal

Having thus obtained his doctorate, Parnas removed to Hofmeister's laboratory in Strassburg where he worked until the outbreak of war in 1914 except for short periods spent on research at th Stazione Zoologica in Naples and in the Physiologica Laboratory in Cambridge The years which he spen with Hofmeister, first as 'assistant' and later a 'dozent', remained in Parnas's memory as his happies ones, and for Hofmeister himself he preserve lasting devotion and admiration His first scientifi contribution from this laboratory, which he submitted to the *Biochemische Zeitschrift* in 1906, wa on the purification, properties and composition c brain cephalin, a subject of which he was very fon but on which he worked only for a few more year

Soon afterwards, Parnas's interest turned to th intermediary metabolism of animal tissues—mor specifically, the physiological significance of th Cannizaro reaction In 1910 he demonstrated tha this reaction, in which two molecules of aldehyd interact to produce one molecule of acid and one c alcohol, is catalysed in the liver by a soluble enzym which he named 'aldehyde mutase' The study c this enzyme formed an introduction to Parnas' further work on enzymic processes underlying th intermediary carbohydrate metabolism of tissue particularly that of muscles Among his other contributions made at Strassburg, three deserve specifi mention (i) the recognition of the fact that of th two optical isomers of lactic acid, one, namely L(+) lactic acid, is metabolized in the animal bod in preference to the D(−) isomer, (ii) the elaboratio of energy requirements for smooth and skeleta muscles, both when resting and during contraction and (iii) a quantitative study—one of the earliest o its kind—of the relationship between the disappearance of glycogen and the formation of lactic acid i isolated, contracting frog muscles In the last

mentioned study, Parnas carried out his experiments partly in collaboration with Richard Wagner, their two names are also linked with the design, a few years ater, of the Parnas–Wagner distillation apparatus for the micro-determination of nitrogen

After the First World War, Parnas returned to his native country and resumed with great vigour his research activities, at first for a short time in Warsaw, and later at the Joannes-Casimirus University in Lwów, where within a few years he succeeded in creating a flourishing centre of teaching and research and in assembling around him a group of devoted and enthusiastic co-workers, often referred to as the Parnas School' Of these, J Heller (now professor of biochemistry in Warsaw) and W Mozolowski (now occupying the chair of biochemistry in Gdańsk) shared with Parnas the credit for the discovery of the process of ammonia formation in blood (1924) and in muscle (1927), and for establishing that this ammoniogenesis is due to the deamination of adenylic acid to inosinic acid. Further intense research on the significance of this process in muscular contraction was greatly facilitated by the method for large-scale preparation of adenylic acid developed in Parnas's aboratory in 1932 by his pupil and co-worker, Paul Ostern (who died tragically during the Second World War).

The Parnas reaction, discovered in 1934, established that adenosine triphosphate, the mother-substance of adenylic acid, is directly involved in the enzymic transfer of phosphate groups, from the phosphorylated intermediary products of muscle glycogenolysis, to creatine This finding, coupled with the Lohmann reaction, formed the basis of much of the later work on the 'chemical linkage' processes, not only in the muscle but also in all other animal tissues, as well as in yeast and bacteria The 1930's were probably the most active period in Parnas's life. Those who, like myself, had the good fortune to be associated with him in that phase of his activity, will remain filled with admiration for his qualities of leadership, his profound knowledge of chemistry and physiology, his exceptional skill in designing experiments, and last but not least, his almost uncanny encyclopædic memory This great gift enabled Parnas to master several languages, to retain faultlessly the names and faces of countless students, to quote page-long excerpts of Greek and Latin poetry, which he learnt as a boy, and to shower upon his pupils scientific facts and chemical formulæ.

As a teacher, Parnas was most stimulating, and his text-book of biochemistry, written in Polish, is a masterpiece Sometimes, carried away by his enthusiasm while lecturing, in exposing the intricate mechanisms of chemical reactions (which he invariably illustrated by the most complicated and ingenious demonstrations), he would forget completely that but few in his student audience were capable of following him A man of exceptionally powerful physique, he used to amuse the medical students by pointing out that there are no data in the existing tables for computing the basal metabolism of a person of his size and weight Yet, this massive frame did not prevent him from constructing and handling the most delicate instruments and apparatus

Parnas's many friends in Britain and elsewhere will mourn the passing of this exceptional man.

T Mann

NEW FELLOWS OF THE ROYAL SOCIETY

AT the meeting of the Royal Society on March 17, the following were elected to fellowship

Prof D R Bates, professor of applied mathematics, The Queen's University, Belfast, distinguished for his contributions to theoretical atomic physics and its application to the interpretation of phenomena in the earth's atmosphere

E. J H Corner, lecturer in botany, University of Cambridge, distinguished for his researches on fungi and on tropical floras

Prof A H Cottrell, professor of physical metallurgy, University of Birmingham, distinguished or his research work, both theoretical and practical, oncerning the mechanical properties of metals

Prof S Devons, professor of physics, Imperial College of Science and Technology, University of London, distinguished for his researches in nuclear physics, including the investigation of short-lived tates of nuclei

Prof A W. Downie, professor of bacteriology, University of Liverpool, distinguished for his contributions to bacteriology and virology and especially into the viruses belonging to the pox group

Prof. K C Dunham, professor of geology, University of Durham, distinguished for his petrological researches, his work on the genesis of ore deposits, and on the stratigraphy of the north of England

Dr D J Finney, reader in statistics, University of Aberdeen, and director of the Agricultural Research Council's Unit of Statistics, distinguished for his work in the development and application of statistics to biological problems, especially in the field of bioassay

Dr A Fleck, chairman, Imperial Chemical Industries, Ltd, distinguished for his contributions to chemical technology and for his pioneering work on the radioactive elements

Prof K J Franklin, professor of physiology, St Bartholomew's Hospital Medical College, London, distinguished for the application of X-ray cinematography to physiological problems, for work on veins and vascular reflexes, and the history of physiology.

Prof W. P Hawthorne, professor of thermodynamics, University of Cambridge, distinguished for his researches in the combination of thermodynamics and hydrodynamics on which the design of high-speed heat engines is based.

Prof D H. Hey, Daniell professor of chemistry, King's College, University of London, distinguished for his original contributions to the study of free radicals of short life as intermediates in chemical reactions, and to synthetical organic chemistry

Sir Harold Himsworth, secretary of the Medical Research Council, distinguished for his contributions to clinical investigation, and especially for researches into the etiology of diabetes mellitus and liver necrosis.

A. F. **Huxley**, assistant director of research in physiology, University of Cambridge, distinguished for fundamental discoveries concerning the conduction of impulses in nerves, and for developing new methods for the study of nerves and muscles.

Prof. R. W. James, professor of physics, University of Cape Town, distinguished for investigations of the structure of matter through the use of X-rays, and particularly for his studies of thermal motions of atoms in crystals.

Dr. D. Lewis, head of the Genetics Department, John Innes Horticultural Institution, Bayfordbury, Hertfordshire, distinguished for his researches on the genetics and physiology of pollination.

Dr. J. W. Linnett, lecturer and demonstrator in chemistry, University of Oxford, distinguished for his work on molecular structure and on the physical chemistry of combustion and flame propagation.

Prof. A. C. B. Lovell, professor of radio astronomy, University of Manchester, distinguished for his contributions to radio astronomy and in particular for his work on the detection and investigation of meteors by radio methods.

Prof. O. E. Lowenstein, Mason professor of zoology and comparative physiology, University of Birmingham, distinguished for his work on the comparative physiology of the vertebrate labyrinth.

Dr. R. A. Lyttleton, lecturer in mathematics, University of Cambridge, distinguished for his original contributions to theoretical astronomy and astrophysics and for his mathematical researches on rotating liquid masses.

Dr. A. G. Ogston, lecturer in biochemistry, University of Oxford, distinguished for the application of physicochemical principles and methods to biological problems.

Dr. G. Pontecorvo, reader in genetics, University of Glasgow, distinguished for his contributions to genetics, especially by his studies of gene action, gene organization, and systems of variation in fungi.

Dr. J. A. Ramsay, lecturer in zoology, University of Cambridge, distinguished for his analysis of factors controlling the water balance in animals and for the elegance of the micromethods he has devised.

Dr. F. C. Tompkins, reader in physical chemistry, Imperial College of Science and Technology, University of London, distinguished for his experimental and theoretical contributions to the study of physical and chemical adsorption, and the thermal decomposition of ionic solids.

Prof. A. G. Walker, professor of pure mathematics, University of Liverpool, distinguished for his work on the foundations of relativity theory, and for important contributions to differential geometry, including the theory of harmonic spaces and the theory of fibre bundles.

Prof. G. P. Wells, professor of zoology, University College, London, distinguished for his studies relating structure and function to mode of life of invertebrate animals, particularly of polychætes.

NEWS and VIEWS

Royal Geographical Society: Awards

H.M. the Queen has been pleased to approve the award of the Royal Medals of the Royal Geographical Society as follows: *Patron's Medal*, to Dr. John K. Wright, lately director of the American Geographical Society of New York, for services in the development of geographical research and exploration; *Founder's Medal*, to Commander (L) C. J. W. Simpson, leader of the British Expedition to North Greenland, 1952–54. The Council of the Society has made the following awards: *Victoria Medal*, to Sir John Russell, for his studies of soils and agriculture and for services to geographical education; *Murchison Grant*, to Dr. H. C. K. Henderson, lecturer in economic geography, Birkbeck College, London, for studies in economic geography; *Back Grant*, to Captain O. C. S. Robertson, for his journey through the North West Passage in one season in the icebreaker *Labrador*; *Cuthbert Peak Grant*, to D. G. A. Bunker, for geographical exploration and mapping in south-west Arabia; *Gill Memorial*, to Dr. Marjorie Sweeting, lecturer in geography, University of Oxford, for contributions to the physiography of limestone areas; *Mrs. Patrick Ness Award*, to Dr. E. F. Roots, senior geologist, Norwegian–British–Swedish Antarctic Expedition, 1949–52.

University Grants Committee: New Members

The Treasury has announced the appointment of four new members of the University Grants Committee to take the place of retiring members, and of two additional members, bringing the total up to eighteen. The retiring members are Lord Adrian, Dr. J. W. Cook, Prof. G. W. Pickering and Sir David Hughes Parry. The new members are Prof. R. S. Edwards, professor of economics with special reference to industrial organization in the University of London; Dr. Willis Jackson, director of research and education, Metropolitan-Vickers Electrical Co., Ltd.; Prof. R. H. Matthew, professor of architecture in the University of Edinburgh; Prof. P. B. Medawar, Jodrell professor of zoology and comparative anatomy, University College, London; Prof. A. Robertson, Heath Harrison professor of organic chemistry, University of Liverpool; and Sir George Thomson, master of Corpus Christi College, Cambridge.

New Nature Reserves

The new nature reserve at Axmouth – Lyme Regis undercliffs in Devon, declared by the Nature Conservancy on March 16, forms the largest and most important landslip area on the coast of Great Britain. There have been periodic slips from the sixteenth century onward of the chalk and underlying greensand on the Gault and Lower Lias clay which dip towards the sea, the most spectacular being that on Christmas Day, 1839, when nearly 8 million tons of rock subsided from a cliff 375 ft. high, leaving a chasm half a mile long and 200–400 feet in width. The new reserve, which extends along some five miles of coast and covers 708 acres, is primarily of geological interest but has a wide variety of soils and is almost completely covered with vegetation, notably a well-grown natural ashwood. Interesting birds and butterflies are also to be found. The Conervancy hopes to arrange for the improvement of the public foot-path through the reserve as a step owards the proposed South Devon Coastal Path, but permits will be required to undertake research, o collect specimens of animals or plants or to visit parts of the reserve away from the footpath, and applications for such purposes should be addressed o the Conservancy at the Furzebrook Research Station, Wareham

On March 16 also the Conservancy declared an extension of 200 acres to the existing Scolt Head Nature Reserve, bringing the whole of the Island, some five miles long, within the reserve The Island has become a classic site for the study of coastal erosion, sand and shingle bank formation and the development of salt marshes There is a well-established breeding colony of Sandwich terns, and during the autumn and spring migrations many rare birds have been recorded The Island's main botanical interest lies in its wide variety of marine and other plant communities on shingle beach, sand dune and salt marsh Access will not be restricted, but permits will be required to collect specimens of animals or plants within the reserve

Astronautica Acta : New Journal of Astronautics

THE first number of a new quarterly entitled *Astronautica Acta*, the official journal of the International Astronautical Federation, has recently appeared, published by Springer-Verlag, of Vienna, and I. R. Maxwell and Co , Ltd , of London, Paris and New York (1, No 1 , 1955 Pp 60 Annual subscription 62*s* or 8 60 dollars). The journal is edited by Prof F Hecht, of Vienna, assisted by an editorial board consisting of W. von Braun (United States), A Eula (Italy), J M J Kooy (Holland), E Sanger and K Schutte (Germany), L R. Shepherd (Great Britain) and J Stemmer (Switzerland), to any of whom contributions may be sent The first number opens with a general statement on the feasibility of flight through outer space by Prof von Braun, and contains four articles on various aspects of astronautics I Sanger-Bredt makes a critical examination of the experimental methods which have been applied to the problem of understanding the fundamental nature of chemical combustion processes and discusses their results H Strughold writes on conditions in those parts of the atmosphere that are physiologically similar to outer space D F. Lawden discusses the optimal programming of rocket thrust direction with the view of achieving the maximum energy increment in the pay-load over a given period of time, this is of interest in the problem of the most economical method of escaping from an orbit Finally, J Eugster shows that the major effects of cosmic rays on photographic plates are also detectable by means of dyes , this is of practical importance in biological work where the use of photographic plates is unsuitable The format and printing are of the fine quality that one expects of the house of Springer. It is to be hoped that the journal will obtain the support it deserves and that the high standard set by its first part will be maintained

Strategy of Research

IN a paper in *Research*, the Earl of Halsbury, managing director of the National Research Corporation, emphasizes that there is a great wealth of latent research talent in the universities and public laboratories partly engaged on pure research of a comparatively low order of significance and available for redeployment into basic research of a higher order (*Research*, 7, No 12 , December 1954). One condition for this is that a number of major targets in applied research should be selected for general attack The administrative machinery of government science is, through its laboratories and its grant-aiding and development contractual procedure, adequate to cope with any demands made on it, while, through the medium of research associations, some initiative can be taken publicly or semi-publicly in specifying the sort of problems in applied science which could form the basis for civilian development contracts financed at the public expense. The major contribution in initiative must come from industry itself, however, and there can be no substitute for this In Lord Halsbury's opinion, where industry fails to show initiative, this springs less from a conflict of view between commercial and technical management than from their common and reciprocal failure to act in concert on the basis of a rational appreciation of the part that each has to play This failure of the rational is linked to a national preference for the intuitive approach to the taking of decisions. It cannot be expected to change rapidly , its study by the methods of the social sciences is necessary if it is to be understood more deeply

Physical Basis of Temperature Regulation in Man

DURING the past fifteen years there has been a steadily increasing interest among physiologists in the nature of the mechanisms associated with human thermo-regulation In a paper entitled "Physical Basis of Temperature Regulation in Man", Prof E M. Glaser, of the Department of Physiology, University of Malaya, Singapore, presented to the Pan-Indian-Ocean Science Congress held last year in Perth, Western Australia, an appraisal of the present situation in this field. He pointed out that any thermostatic system is imperfect in that it must have a finite load error Owing to the large thermal inertia of the body, a mechanism concerned only with the maintenance of an approximately constant deep-body temperature would be at best inefficient and at worst unstable. The performance is, in fact, profoundly affected by the derivation of thermal information from the surface of the body as well as from the deeper tissues The resulting control is less precisely thermostatic, as is shown by the considerable variations in deep-body temperature which it permits, but has the virtues of increased flexibility and very much more rapid response to changes in environmental conditions. It may be regarded as primarily controlling thermal balance (homeothermokatametry) rather than deep-body temperature (homeothermy) The physiological responses involved in long-term acclimatization to heat and cold present a problem unique in the field of thermostatics, since the continued operation of responses of one sort appears to cause changes in the sensitivity of the whole control mechanism

Scientific Approach to Cancer

THE March issue of the *Practitioner* is devoted mainly to the cancer problem, and besides an article on "Our Present Understanding of the Cancer Cell" by Prof A Haddow, there are review articles on the place of surgery (H Atkins), radiotherapy (A P Wood and R Morrison), chemotherapy (Edith Paterson), endocrinology (B. J Kennedy) in treatment, and, because of its current high incidence, an article (Sir Clement Price Thomas) devoted to carcinoma of the lung. All these summarize the present position very clearly, and it is noteworthy that all the authors foresee the eventual therapeutic solution in some form of chemotherapy. Prof. Haddow's summary of some of the fundamental experimental work is likely to be of interest to many readers of *Nature*, and it can be heartily recommended as giving in small compass an excellent idea of the main scientific approaches to the problem. It shows how we are beginning to regard the first ('initiation') stage of chemical carcinogenesis as being a combination of the chemical or its metabolites with one or more specific tissue constituents, and the second ('promoting') stage as one of continued proliferation or delayed maturation of the 'initiated' cells, with the final stage (neoplasia) emerging after protein deletion. One current view is that the cancer cell is such because it has lost key proteins essential for the control of growth. With the plethora of facts, attempts to arrive at a unifying hypothesis showing how the diverse and very numerous 'initiating' agents all have the same end result is becoming essential. What is the common factor in carcinogenesis induced by aromatic amines, polycyclic hydrocarbons, ionizing radiations, viruses, hormones and even prolonged tissue culture of some normal cells? This article adequately condenses much of the main evidence which has to be embraced in such a hypothesis. Attention is directed to the recrudescence of interest in tumour immunology, though without discussion. The present writer believes that future articles of this type will perforce discuss this subject more and more, for he has himself recently put forward evidence which supports Prof. Haddow's evaluation of its being "the most logical of all approaches".

Radioiodinated Human Serum Albumin

The Radiochemical Centre (White Lion Road, Amersham, Bucks) can now supply human serum albumin which has been iodinated with radioactive iodine-131 to hospitals and research institutions in the United Kingdom in the same way as it supplies iodine-131. The product (Code No. 1*B*.17) is in an isotonic saline solution (*p*H 9·0–9·2), which is sterile and free from pyrogens, and is packed in 10-ml. rubber-capped multi-dose bottles. The specific activity is not less than 5 mc./mgm. albumin, and the minimum concentration is 100 mc./ml. solution. The protein is iodinated uniformly, and the amount of iodine present is less than 0·2 per cent of the weight of albumin. The active iodine is firmly bound to the protein molecules, and not more than 2 per cent of the total activity is in the form of free iodide at the time of dispatch. Particular care is taken to avoid denaturation, and the product cannot be distinguished from the original albumin by electrophoresis. The product is supplied in standard packages containing either 0·2 mc. (£3) or 1·0 mc. (£5), larger quantities up to 5 mc. being available by arrangement (£5 per mc.). The human albumin is supplied by the Ministry of Health free of charge, and the price of the iodinated material includes only the cost of manufacturing and testing.

Effects of Radiations on Human Populations

In an address delivered on January 11 to the California Institute of Technology, Dr. A. H. Sturtevant discussed the hazards of the increase in high-energy radiations to which human populations are already exposed as a consequence of atom and hydrogen-bomb tests and medical and other activities. He distinguished the two types of hazards: those to the exposed individuals and those to their descendants, and emphasized the appalling ignorance in which we are as to the long-term biological effects of radiations. Extrapolating from *Drosophila* to man, the present increase of radiation due to 'fall-out' from bomb tests would be responsible for the conception of 1,800 more individuals per year heterozygous for recessive lethals in the whole world. Dr. Sturtevant stressed that, in view of its social significance, scientists must try to get some idea of how much of what may be happening, and to how many people.

School Nature Study Union

The first number of the fiftieth volume of *School Nature Study*, the journal of the School Nature Study Union, which appears in a new and attractive form, contains details of new activities by the Union (George Philip and Son, Ltd., London. 2*s*. 6*d*.). Besides the usual meetings and excursions which are organized in and around London, some provincial areas are showing interest in the Union's activities, and there is a possibility of a branch being formed in the Midlands. The journal contains some useful hints by John Sankey, assistant warden of the Juniper Hall Field Centre, on the ways of taming wild animals like foxes and badgers, an article by E. T. Cluff on the behaviour of 'winter gnats', and other articles and reports on a number of conferences and meetings.

Tanganyika Agricultural Corporation

The work in Tanganyika of the Overseas Food Corporation is to be continued by a new organization, the Tanganyika Agricultural Corporation, which will come into being on March 30. It will operate in the areas taken over from the Overseas Food Corporation and will be financed for this purpose until September 1957 by a Colonial Development and Welfare grant from the British Government. The new Corporation will also be invited by the Government of Tanganyika to assist in carrying on the Rufiji Basin reconnaissance survey which is at present in progress under the ægis of the United Nations Food and Agriculture Organization. In particular, it will be asked to establish the trial farms that are being planned as part of this investigation. In addition, consideration is being given to other agricultural development projects which might with advantage be undertaken by the Corporation, by agreement with the Government.

Physical Society's Exhibition

The Physical Society's annual Exhibition of Scientific Instruments and Apparatus will be held in the Royal Horticultural Society's New Hall, Greycoat and Elverton Streets, London, S.W.1, on the following dates: April 25, 10.30 a.m.–8 p.m. (Fellows and press only, 10.30 a.m.–2 p.m.), April 26 and 27, 10 a.m.–8 p.m., and April 28, 10 a.m.–5 p.m. The discourses this year will be as follows (each one at 6.15 p.m.): April 25, the free electron as a tool in scientific research, by Mr. M. E. Haine (Associated Electrical Industries, Aldermaston); April 26, memory systems in the brain, by Prof. J. Z. Young (Department of Anatomy, University College, London); and April 27, recent developments in luminescence and its applications, by Dr. G. F. J. Garlick (Department of Physics, University of

Birmingham). As in previous years, the Society is ublishing a "Handbook of Scientific Instruments and pparatus" in connexion with the Exhibition (6s , or s by post) All inquiries should be sent to the ociety at 1 Lowther Gardens, Prince Consort Road, ondon, S W 7

University of Birmingham : Appointments

THE title of reader in organic chemistry in the University of Birmingham has been given to Dr E J Bourne, senior lecturer in organic chemistry The following appointments have recently been made in the University Dr B G Gowenlock, to be lecturer in chemistry , G Webster, Edward Cadbury Fellow in archæology, to be staff tutor in archæology , and S J Lyle, to the J Lyons fellowship in analytical chemistry The title of University research fellow has been given to the following during the tenure of their present posts Dr H Spedding, of the British Cotton Industry Research Association, who is working in the Department of Chemistry, and Dr J S Howell, who is working in the Department of Pathology, for the Birmingham Branch of the British Empire Cancer Campaign Committee

Belgian Physical Society : Officers

AT the annual general meeting of the Société Belge de Physique, held on February 19, the following officers were elected *President,* Prof P Swings Liège) , *Vice-Presidents,* Prof W de Keyzer (Ghent), Prof J. Delfosse (Louvain) and Prof G A Homes Brussels) , *Secretary General,* Dr M C Désirant A C.E C Physics Research Laboratory, Charleroi)

The Night Sky in April

FULL moon occurs on April 7d 06h 35m , U T , and new moon on April 22d 13h 06m The following conjunctions with the moon take place April 10d 03h , Saturn 6° N , April 20d 05h , Venus 7° S , April 25d 02h , Mars 0 7° S , April 28d 02h , Jupiter 3° N In addition to these conjunctions with the moon, Mars is in conjunction with Aldebaran on April 25d 23h , Mars being 6 4° north of Aldebaran. Mercury, in superior conjunction on April 23, is unfavourably placed for observation during the month Venus rises at 4h 40m , 4h 20m and 4h. on April 1, 15 and 30, respectively, and will be visible for a short time before sunrise Its stellar magnitude varies from −3 5 to −3 4, and the visible portion of the illuminated disk from 0 756 to 0 835 , this increase does not compensate for the planet's recession from the earth—from 107 to 124 million miles between April 1 and 30—so that there is a small decrease in brightness Mars sets about 22h 30m. during the month and has an eastward movement in Taurus , its close approach to Aldebaran on April 25 has been pointed out Jupiter remains visible until the early morning hours, its times of setting being 2h. 55m , 2h 05m and 1h 10m at the beginning, middle and end of the month, respectively, and is a conspicuous object in Gemini , in the third week of April it is a little south of κ Geminorum , its stellar magnitude varies from −1 8 to −1 6, the decrease in brightness being due to its distance from the earth increasing from 465 to 508 million miles during the month. Saturn rises at 22h , 21h and 20h on April 1, 15 and 30, respectively, and has a retrograde movement in Libra , its brightness increases by 0 2 mag. during the month, owing to its distance from the earth decreasing from 847 to 828 million miles Only one occultation of stars brighter than magnitude 6 occurs in April, observations being made at Greenwich April 2d 22h 42 1m , *h* Leo (*D*), *D* referring to disappearance. The Lyrid meteor shower attains a maximum on April 21 , the radiant of this shower is at R A 18h , Dec. 33° N.

Announcements

THE Baekeland Memorial Lecture of the Plastics and Polymer Group of the Society of Chemical Industry will be given in the Royal Institution, London, W 1, on June 2, by Dr C E. K. Mees, who will speak on "Leo Hendrik Baekeland and Photographic Printing Papers".

A MEETING is being held under the auspices of the Institute of Biology on April 15 at the Polytechnic, Regent Street, London, W 1, to discuss the place of biology in technical colleges Speakers will include representatives of industry, agricultural research and the Ministry of Education, an external examiner of the University of London and several lecturers from technical colleges The meeting is open to all interested, and further information can be obtained from the General Secretary, Institute of Biology, Tavistock House South, Tavistock Square, London, W C 1

THE essay subjects for this year's *Endeavour* prizes of the British Association for the Advancement of Science will be as follows the earth's magnetism , man-made fibres , climatic changes , scientific aids to food supply , respiration , and new metals for engineers The essays must be sent in by June 1 and should not exceed four thousand words. Competitors must be less than twenty-five years of age, and the prizes will be 50, 25 and 15 guineas respectively, with two special awards of 5 guineas to those less than eighteen Further information can be obtained from the Assistant Secretary, British Association for the Advancement of Science, Burlington House, Piccadilly, London, W.1

THE Textile Institute is offering a three-year scholarship, of total value £950, which is open to a man of British nationality, and less than twenty-four years of age, to enable him to pursue a three-year course in textile technology at a university, or equivalent, level The Institute is also offering two new scholarships, to be known as the Peter Coats Scholarships, for young men of about school-leaving age to study for a college diploma or other qualifications in subjects connected with the cotton industry. The scholarships will be worth not more than £100 a year, tenable for two or three years in a British technical college The closing date for entries for all these awards is April 30, application forms and further information being obtainable from the General Secretary, Textile Institute, 10 Blackfriars Street, Manchester 3.

FROM £8,000 of the United States Counterpart Funds for economic aid, the Ministry of Agriculture and Fisheries is offering a number of postgraduate scholarships during the academic year 1955–56 for vocational training in the following subjects agricultural economics, farm management, estate management, and land economics and land use The scholarships will be worth £400–800, free of income tax, plus all compulsory fees and other expenses, and are open to British subjects resident in the United Kingdom Application forms, to be returned by April 30, and further information can be obtained from the Secretary, Ministry of Agriculture and Fisheries, 1–4 Cambridge Terrace, London, N W 1

ORGANIZATION OF APPLIED RESEARCH

EIGHT annual conferences on the administration of research have been held in recent years in the United States. The interest in research administration is growing with its importance, and technical assistance missions sponsored by the Organization for European Economic Co-operation visited research establishments in Western Europe in 1951, and the United States and Canada in 1952. Their observations and conclusions have been published in three volumes under the general title "The Organization of Applied Research in Europe, the United States and Canada" (see *Nature*, **174**, 778 , 1954)

In spite of its manifest importance—it is reported that the United States alone is now spending three billion dollars annually on research—no conference on research organization had been held at an international level until that which took place in Nancy during October 11–15, 1954, arranged by the European Productivity Agency Moreover, it is perhaps significant, and possibly strange to British ideas, that according to one delegate such a conference could not have been convened five years earlier The conference was distinctly European, with about one hundred delegates from Western Europe and with American representatives as observers As such, the many and varied expressions of opinion referred largely to the problems and difficulties of Western Europe

Three separate approaches to the central theme were made on each of three succeeding days The first day was devoted to the subject of "The Practical Organization of Research" , the second to "The Human Factor in Research and Team Work" , and the third to "The Dissemination of Results of Research and their Implementation" Each day's papers and discussion were summarized by a series of 'conclusions' which, it is hoped, will provide springboards for action in the different countries represented

Papers at the first session were delivered by Dr L Henry (Belgium), Dr D W. Hill (Great Britain) and Prof M Letort (France). To some extent the discussion inevitably tended to centre around the relations between universities and industry—a major problem which has not yet been solved in Europe. It was generally considered that, while universities and industry must be brought closer together, each recognizing and, indeed, catering for the needs of the other, the American solution of extensive applied research projects in universities has progressed too far in one direction, to the possible detriment of the pure research function of the university. This led naturally to a discussion of how much applied research a university can undertake, in order to assist industry and strengthen its teaching function without undermining its research function

Attempts to define the problem resulted, despite a plea from the chairman, Dr. A King (Great Britain), in a discussion of the meanings of pure and applied research. In this connexion a phrase used by Prof Maurice Letort (France) sticks in the memory in pleading for a recognition that applied research could often be sufficiently fundamental to satisfy the strictest purists, he described the kind of applied research which could usefully be done in universities, and which is already the main occupation of central research organizations, as "directed basic research" —that is, fundamental research directed to a usefu end It was Prof. Letort, too, who probably gave the last word on this subject Expressing his conviction that the dichotomy of pure and applied research is, in fact, non-existent, he pointed out that since there must be some choice of subject, the academic research worker should choose a field with a big hinterland rather than one which would yield immediate technical results

The conclusions of the session reflected the discussion, especially with their insistence upon the need for applied research, the interdependence of academic research and industrial development, the need to preserve the freedom of academic research and the desirability of governments assisting research of all kinds both directly and by fiscal policies which encourage research expenditure

The discussion on the second day was remarkable in that human factors had never before been discussed at a conference in Europe, and no less so in that the British delegates listened intently but made only one very brief contribution to it. It was evident that the human problems of Continental Europe are not those either of Great Britain or the United States The chairman, Mr V. Lasareff (Organization for European Economic Co-operation), emphasized what is perhaps not generally recognized, namely that, in applied research, productivity depends more upon the human factor than upon any other The importance of the human factor can therefore scarcely be over-estimated There can be little question that, of all the problems of research, the human ones, particularly the reconciliation of the interests of the community with those of the individual, present the widest differences between countries For this reason, the last conclusion of the day, though apparently the most innocuous, may in the long run prove to be the most effective This conclusion adopted a suggestion from Mr. Lasareff that the participating countries should compare their methods for selecting and evaluating staff This should prove a relatively simple, but possibly very rewarding, task for the Organization for European Economic Co-operation.

After recognizing the importance of human problems in research, other conclusions directed attention to the need to provide both prestige and material satisfaction for the research worker, to the need for security, to the recognition of the value of research training for high industrial positions, and to the desirability of selecting research directors as much for their aptitude for leadership as for their scientific knowledge. More controversial, perhaps was a conclusion that education from school-days onwards should aim at emphasizing the importance of research and preparing young people for team work and its discipline

An absorbingly interesting paper on the evening of the second day, by Dr J W. Barker (United States) outlined the conception, philosophy and practice of the Research Corporation of New York, and introduced the subject of the patenting of research results This was followed on the third day by an exposition of his views by Signor L Morandi, vice-president of the Montecatini Company of Italy. The subsequent discussion on patents, though interesting, could scarcely be said to add much to the vast experience gained by the Research Corporation of New York and so fully put at the disposal of the conference by Dr Barker

The remainder of the discussion on the third day was largely concerned with the dissemination of research results Documentation methods were reviewed in detail, and it was concluded that if efficiently pursued they will largely meet the needs of science and technology, but that the conventional methods do not fit the demands of the smaller firms A recommendation was therefore adopted that the European Productivity Agency should encourage study designed to solve this aspect of the problem On a wider approach, it was concluded that the knowledge of the impact of research on a dynamic civilization should be diffused as widely as possible As Dr J S Whitehead (Great Britain) pointed out in his paper, it is desirable to establish a climate of public opinion favourable to science, in order to ensure its widest application in national life Such a climate, when established, affects influential people —those who have the direction of affairs—so that they take decisions in line with the needs of science

To the present writer, at least, it was a matter of regret that more was not said on the implementation of the results of research, for this is a crucial point to which a whole conference might well be devoted We are commonly told that only a small proportion of research results are capitalized, and that many research organizations could now be well employed ensuring the application of past results for the benefit of industry, rather than piling up new ones to be cast into the limbo with the old It would be interesting to discuss whether this is true or not, and if so, why Are there multitudinous results potentially valuable to industry, available and unused ? If so, is it the fault of industry or research ? Is it the cost of development or the fear of obsolescence ? Or is it fiscal policies or innate conservatism, either on the part of industry or of its customers—the public ? It is gratifying to know that the Applied Research Division of the European Productivity Agency is now planning a preliminary survey on the development of inventions Its report, when available, might well form the basis of a future conference

As was pointed out during the conference, research has been revolutionized during the past twenty-five years No greater evidence of this could be forthcoming than the holding of such a meeting Nevertheless, it is to be hoped that none of the delegates believes the conference to have been an end in itself It was an opportunity for sharpening wits, comparing notes, receiving new points of view—all with the object of returning to the various countries represented to try them out in practice For, when all is said and done, research organization is not yet a science but an art, and an empirical art at that, so that despite the conclusions no one is likely to dispute the wise words of Prof M Letort, "No authoritarian measure or administrative rule can create that confidence and goodwill which are the essential conditions of fruitful collaboration", which is the basis of successful research. With this background, the delegates naturally accepted a final conclusion that a similar conference dealing with the aspects of co-operation in research should be held in a year or two's time

It would be ungracious to conclude this report without a reference to the excellent arrangements made for the conference by the European Productivity Agency and the University of Nancy The success of the occasion was due in no small measure to the meticulous organization , and the gratitude of the participants will be directed especially to the rector of the University, Dr J Capelle, who also acted as secretary of the conference and who was unsparing in his efforts on their behalf

D W Hill

AERATION IN INDUSTRIAL FERMENTATIONS

On January 12 the Society for Applied Bacteriology and the Microbiology Group of the Society of Chemical Industry held a joint meeting to discuss "Aeration in Industrial Fermentations" Dr L A Allen was in the chair Both the microbiological and the physical aspects of the subjects were considered, four papers being given and a short film shown

In the opening paper, by A L Downing and G A Truesdale, Mr Downing described some factors affecting the rate of solution of oxygen in water The data were obtained from laboratory experiments designed to provide information about re-aeration in a polluted estuary Relatively small changes in rate of solution of oxygen, expressed as an exit coefficient, resulted from the action of mixing currents or of air-streams forced tangentially over the surface, provided that the surface remained largely undisturbed Increasing the rate of mixing beyond the point at which vortices were formed caused a rapid increase in exit coefficient, high rates of solution being ultimately attained Similarly, the exit coefficient increased rapidly as the surface was increasingly disturbed by air-streams having velocities exceeding a critical value equivalent to 6–7 m /sec at 10 m above the surface Increasing the height or frequency of waves, generated mechanically, caused an approximately linear increase in exit coefficient Under different conditions of surface agitation the exit coefficient increased linearly with increasing temperature in the range 0–35° C The mean value of the temperature coefficients of the exit coefficient (defined as the increase in exit coefficient expressed as a percentage of the value at 20° C per deg C increase in temperature) was 2 37 Films of oil on the surface caused little effect until their thickness exceeded 10^{-4} cm. Except when fracture of the film occurred, the exit coefficient was steadily reduced as the thickness was increased from 10^{-4} cm to 10^{-1} cm Soluble surface-active agents, on the other hand, caused reductions in rate of solution which increased with increasing concentrations up to 1 0 p p m but which tended to a limiting value

The mechanics of bubble formation was then discussed by Mr R H Bowers, who prefaced a description of his experimental work with a review of data obtained by other investigators Datta and his co-workers showed that the measured size of bubbles issuing from a single open-ended tube, at low rates of flow of gas, agreed approximately with a theoretical formula derived by equating surface tension and buoyancy forces As the rate of flow of gas was increased, the bubbles became larger Van Krevelen has suggested a mechanism from which expressions for the size of both very large and small bubbles can be derived In many industrial fermentations high flows of gas are required, and, if a simple perforated sparger is used, large bubbles are formed, which can lead to poor aeration Bubbles produced from porous diffusers having a large number of orifices and a low rate of flow through each are in some cases smaller than would be predicted from the theoretical equations A mechanism to account for this has been suggested and confirmed experimentally by Pattle The properties of the liquid have a pronounced effect in these cases If a mycelium is built up during fermentation, bubbles become trapped and coalesce. In Mr Bowers's experiments the rate of absorption of oxygen from bubbles formed with a porous ceramic plate was reduced by a factor of 20 by 2 per cent of paper pulp added to simulate mycelium This factor was reduced to approximately 7 by agitating the liquid above the plate with a turbine-type stirrer In an apparatus in which dispersion of the gas was brought about by the mechanical agitator itself, the effect of the paper pulp was reduced still further to a factor of about 2

Mr P E Sawyer presented a paper by Prof F H Garner and himself on surface-active effects within gas bubbles The presence of surface-active agents in solution may appreciably influence the behaviour of rising gas bubbles owing to the formation of an adsorbed film at the bubble interface. The principal effect of such an adsorbed interfacial film is to modify the hydrodynamic properties at the gas–liquid interface. Normally the interface between a rising bubble and a liquid permits the transmission of viscous shear across it, resulting in the formation of toroidal circulation currents within the bubble The drag exerted by the liquid on a circulating bubble is lower than that exerted if the bubble acts as a solid spheroid, and the velocity of ascent of the bubble is thus increased The presence of a surface-active agent in the liquid may produce a semi-rigid or rigid structure at the interface which resists the transmission of shear and may inhibit or completely suppress circulation

Mass transfer between a rising bubble and a liquid is also dependent on the character of the interfacial film Internal circulation is accompanied by a considerable reduction in the resistance to mass transfer in both phases Thus an adsorbed film will reduce mass transfer-rates by inhibiting circulation, in addition, the film may itself constitute a resistance to mass transfer, possibly by molecular interaction or by mechanical obstruction The presence of surface-active agents may have an important secondary effect upon the path and shape of a rising bubble Over a certain velocity-range bubbles normally rise with a spiral motion, surface contamination, however, changes this into a zig-zag motion in one plane The reduction in surface tension produced by surface-active agents may also lead to changes in the shape of the bubble and to an increased tendency to oscillation

The effects of certain variable factors on the formation and behaviour of gas bubbles in water, some of which had been referred to by the speakers, were strikingly demonstrated, in slow motion, in a short film The effects of varying the rate of flow of gas, the diameter of the hole from which the bubbles were formed, and the motion of the water were shown Dyes injected into the liquid or polarized light were used for illustrating the characteristics of the fluid dynamics around the bubble

Dr G N Rolinson dealt with the effects of aeration on fungal metabolism One of the striking differences between moulds and bacteria is that there are no anaerobic moulds It is extremely doubtful whether any growth takes place when fungi are completely deprived of oxygen Aeration is frequently a limiting factor in fungal cultures, increased aeration increasing both the amount and rate of growth, and increased aeration frequently results in an increased rate of respiration, since a more extensive respiratory mechanism is synthesized The respiratory quotien of mycelium grown under conditions of high aeration may be more than double that of mycelium grown under low aeration One respiratory mechanism developed in response to the level of aeration appears to be the cytochrome system. Mycelium of *Penicillium chrysogenum* oxidizes lard oil rapidly when grown under conditions of high aeration, but only slowly when grown under conditions of low aeration High rates of aeration are essential for high yields o penicillin Maximum rate of penicillin production by washed mycelium of *P. chrysogenum* has been found to be dependent on the mycelium being permitted to respire at its maximum rate. This is similar to effects observed in citric acid production whereas, in contrast, the maximum production of α-amylase occurred when the rate of respiration was below the maximum In addition to the yeasts, many of the Mucors and Fusaria also carry out vigorous alcoholi fermentation when deprived of air Under aerobi conditions, alcoholic fermentation is depressed, and so also is the rate of glycolysis. Thus, the Pasteu effect, is probably caused by a lack of inorgani phosphate under aerobic conditions Aeration may also effect metabolism by sweeping away carbon dioxide which might otherwise be assimilated

The subjects raised in the lively discussion following the papers covered a wide field. Questioner were interested in methods of deoxygenation of water in the design of absorption vessels and stirring mechanisms and in the performance of different type of aeration systems Methods of measurement o dissolved oxygen concentrations were considered Several speakers cited instances in which polarographic techniques had been used with success Th general opinion was that aeration studies could be o considerable value in improving practical fermentation processes, although rate of aeration was no always a factor limiting rate of production Impedances in the organisms themselves were sometime the controlling factor. In replying to question arising out of his paper, Dr Rolinson said tha yeasts grown aerobically would probably not grow afterwards in complete absence of oxygen, althoug some growth might occur in partially anaerobi conditions. With regard to the Pasteur effect, thi is not a permanent alteration of the enzyme system He agreed that impedance across the cell wall canno readily be distinguished from inability of enzym systems to utilize oxygen when it became available

---

TREND AND PATTERN OF FERTILITY IN GREAT BRITAIN

THE sixth, and final, volume of the Papers of th Royal Commission on Population describes th family census of 1946—its origins, methods an defects—and goes on to analyse in great detail th information collected The joint authors are Pro D V Glass, of the London School of Economics, an Prof E Grebenik, of the University of Leeds

The family census was taken because some of th most important demographic questions with whic the Royal Commission on Population was concerne could not be answered in any other way. Since the normal census machinery could not be used, the family census was taken on a sample basis, the desired information being collected from a 10 per cent random sample of the women in Great Britain who were, or had been, married. It had no statutory sanction, but just over 87 per cent of the women responded—a very high response for a voluntary investigation. The extent of bias arising from non-response was examined, and it was found that any effect on the validity of the results could be safely discounted.

In part, the examination of the results follows the pattern customarily found in fertility censuses, in which the basic tables relate to the total number of children which the women had had by the time of the census. These tables show, for example, that of the women covered by the family census, 66 per cent had had not more than two children, and only 9 per cent had had six or more. On average, each woman had 2·3 live births by the time of the census. Dividing the women into two broad social groups, manual and non-manual (based on the husband's occupation), the corresponding averages are 2·52 and 1·90 live births.

Study of the information by date of marriage shows clearly the decline in family size: for example, a woman married in 1920 had only about half as many children as a woman married before 1890—about 2·5 children in the former case, and about 5 in the latter. Whereas in the late nineteenth century families of five or more children constituted three-fifths of all families, the marriages of 1925 were dominated by one- and two-child families. Over this period, too, childlessness had doubled in frequency.

The statistics for all marriages (including childless marriages) show a consistent fall in family size with increasing age at marriage. But it is also shown that the relation between age at marriage and final family size is becoming somewhat less rigid. This is the kind of development which would be expected with the increasing acceptance of 'family planning' and with the spread of the small family.

A special feature of the family census was that the date of birth of each child was recorded. This information made possible the comparison of the families of different groups of marriages after different durations of marriage. For example, it was possible to compare the families, after six years of marriage, of women married in 1930 with the families, after six years of marriage, of those married in 1940. Such comparisons have enabled the authors to give a much clearer picture of current trends, and to make some tentative suggestions about the future.

The statistics show that the fall in family size has been accompanied not so much by a more wide-spread spacing between births, as by a contraction in the span of years during which children are born.

The general trend of ultimate family sizes, as deduced from the partial records available, shows a continued but slow fall in size of completed family for the marriages up to 1930, a fluctuating stability for the marriages of 1931–40, and thereafter a suggested increase in family size.

The data on family sizes have also been used for constructing replacement-rates indicating whether, with a continuance of fertility, marriage and mortality at certain specified levels, the population would ultimately increase or fall. For the women born in 1895–99, the estimated rate is only 0·74, well below the 1·0 which would show adequate long-term replacement of population. For more recent generations the replacement-rates will be higher, but the complete record of childbearing is not yet available. Marriage-rates have, however, been calculated and give a reasonably clear picture of the situation. Taking the marriages of 1941–43, the estimated rate ranges between 0·94 and 0·98, and this, although based in part on projected data because the families of these women are not completed, serves to suggest that the replacement-rates likely to result from recent marriages are not far from 1·0.

Far greater difficulties arise in attempting to predict the future of family size. Examination of the data suggests that family limitation is even more widespread in Britain than has been previously estimated, and that a further substantial fall in fertility is unlikely to occur simply through an extension of family planning. The analysis suggests that a new stability has developed in recent years, and that there may in fact have been some increase in family size since the Second World War. These developments have accompanied the spread throughout the community of the small-family pattern; nothing so far visible in the statistics foreshadows a major departure from that pattern in the near future.

NATIONAL RESEARCH DEVELOPMENT CORPORATION

REPORT FOR 1953–54

THE chief feature of the report and statement of accounts of the National Research Development Corporation for the year ended June 30, 1954*, is the quinquennial review of the Corporation's work, and this will be discussed separately. Among the new development projects in which the Corporation has interested itself during the year is a stereoscopic ciné camera, the development of which might be advantageous for educational, medical, scientific and technological purposes, and a technique for simplifying and economizing in the wiring of electric circuits.

Of projects already referred to in previous reports, the electronic digital computer continues to be the Corporation's largest single project, more than £325,000 of the £928,000 borrowed by the Corporation representing stocks, work in progress or patent expenditure in this field. Six big computers of the University of Manchester type have been ordered and have been or are being built for the Corporation's account, of which five have been sold and will have been delivered during 1954–55. The much less costly 401 Mark I computer has been transferred to Rothamsted Experimental Station after completing its trials at the Mathematical Laboratory, Cambridge, and is in routine use for calculations relating to agricultural statistics and other purposes. The design of a further computer embodying many of the successful devices in the prototype 401 has also been decided. The Packman potato harvester is now out of the development stage, and a number of machines are being made for the harvest this year. The Ricardo light steam-engine is now available for exploitation, and good progress has been made with the process of extracting hecogenin from sisal juice and purifying it to hecogenin acetate. Production and marketing of the chick sexer and aural microscope are proceeding satisfactorily.

---

* National Research Development Corporation. Report and Statement of Accounts for the Year 1st July, 1953, to 30th June, 1954. Pp. 20. (London: H.M.S.O., 1955.) 9d. net.

Of the 664 inventions communicated to the Corporation during the year, 268 were from government departments and research councils, 50 from Commonwealth official organizations, 18 from industrial research associations, 38 from universities and 269 from British firms and individuals. The rights of 375 patents and patent applications were assigned to the Corporation during the year, of which 315 were from government departments and research councils, 14 from industrial research associations, 30 from universities and 8 from British firms and individuals. The Corporation now holds some 2,647 United Kingdom and overseas patents and patent applications, and, of the 272 licence agreements with industry in force, 99 were revenue-earning, producing £27,650 during the year.

CENTRAL LABORATORIES FOR SCIENTIFIC AND INDUSTRIAL RESEARCH, HYDERABAD

REPORT FOR 1953

THE annual report[*] for 1953 of the Central Laboratories for Scientific and Industrial Research, Hyderabad, stresses the increasing number of postgraduate students—twenty-two were working in the Laboratories for their Ph.D. in 1953—as evidence of the increasing contribution of the Laboratories both in training and in scientific and technical research. The research staff now numbers fifty-eight, and the report lists twenty-five papers published during the year, apart from forty communicated to the forty-first Indian Science Congress, held at Hyderabad in 1954.

In the Oils Section of the Laboratories, work was carried out on local bleaching earths, and on the preparation of dehydrated castor oil giving completely tack-free films and of alkyd resins modified by castor oil. The solubility and effectiveness of aca-catechin and katha-catechin as antioxidants in ghee were studied, the separation of fatty acid mixtures by adduct formation with urea was shown to be a much simpler method than conventional methods, and a suitable method was worked out for refining cotton-seed oil on a cottage-industry basis. The Entomology Section continued its studies of the toxicity of the seed oil from *Annona squamosa* (sitaphal) to vertebrates, and this oil appears to be fungistatic rather than fungicidal to *Helminthosporium* (paddy). The Paper Section was placed on a semi-commercial scale, and good progress was made in the manufacture of drawing paper and bond paper. In the Fuel Section the erection of the 12 ton/day ovoid briquetting plant was completed and the plant put into operation, experiments on binders for low-temperature tar continued. Further work was carried out on the distillation of low-temperature tar, the solvent extraction of tar acids and hydrocarbons from coal tar oils, and on benzole recovery from the low-temperature carbonization gas, while a systematic survey of the coalfields of Hyderabad commenced in July 1953.

The Heavy Chemicals and Fertilizers Section was occupied with the utilization of felspar (including studies of bricks from felspar sludge and on the influence of silica on the recovery of potash by the calcination process) and of iron pyrites (including the preparation of manganese dithionate, manganous sulphate and sulphur), the preparation of activated charcoal from teak-wood sawdust and from groundnut hulls, and the thermal decomposition of manganese sulphate and calcium sulphate to produce sulphur dioxide. The Ceramics Section made a systematic study of Hyderabad clays and the preparation of fireclay refractories from such clays. Investigations on potential synthetic analgesics in the Organic Chemistry, Pharmaceuticals and Drugs Section covered compounds of the quinazoline type and a new synthesis of pethidine. Studies on Indian turpentine included the preparation of a chlorinated product which was highly toxic to various insect tests, and work on the synthesis of menthol. In the work on compounds with œstrogenic activity, stilbene compounds were obtained by condensation of 3-chlorobutanone with phenol or its ethers in presence of sulphuric acid or anhydrous aluminium chloride, but the reaction is not general for α-halogeno ketones. The synthesis of 'Vanitrope' (2-ethoxy-5-propenylphenol) is being attempted and also the preparation of fine chemicals from fusel oil, while a series of ketones obtained by condensing lævulinic acid with aromatic aldehydes are being examined as plant growth regulators.

The Biochemistry Section has given its attention chiefly to the fermentation of pre-treated molasses to citric acid, to itaconic acid fermentation, to oxidations by *Pseudomonas fluorescens* and to the nitrogenous constituents of the seed cake of *Annona squamosa*. In the X-ray Section, X-ray studies were made of Hyderabad and Indian clays, while the Physical Chemistry Section investigated the conductivity of sulphuric acid in aqueous acetone and ethyl alcohol and the titration of tartaric acid with potassium dichromate. Besides the erection of the 25-ton/day low-temperature carbonization pilot plant, the Chemical Engineering Section completed work on the saturation solubilities of groundnut oil and cottonseed oil in aqueous ethyl alcohol and was further equipped with pilot-plant items for cottonseed processing, vacuum distillation and the manufacture of synthetic resins.

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY, LONDON

REPORT FOR 1953–54

THE forty-seventh annual report of the governing body of the Imperial College of Science and Technology, London, covering the year ended July 31, 1954[*], gives some details of the immediate proposals for expansion. Licences have already been granted for the erection of an additional story over the Goldsmiths' Company's extension to the City and Guilds College and the Royal School of Mines building, the first part of the extension of the chemical engineering building and the addition of two stories to the Union building. In January this

Introduction to

Nuclear Engineering

By RAYMOND L. MURRAY

Professor of Physics, North Carolina State College of Engineering

After defining what is meant by nuclear engineering and describing its broad scope, Dr Murray discusses in detail the technology and problems of atomic energy in all its phases. An indispensable text-book for the student of nuclear physics *Illustrated* 30s.

Atoms in the Family

By LAURA FERMI

The wife of the designer of the first atomic pile tells of their life together. A gay, endearing biography of a charming family it sketches the personalities of many of the present atomic scientists *Illustrated* 18s.

MESONS

AND FIELDS

Volume I : FIELDS

by HANS A BETHE, *Laboratory of Nuclear Studies, Cornell University*, SILVAN S. SCHWEBER, *Carnegie Institute of Technology*; and FREDERIC DE HOFFMANN, *Los Alamos Scientific Laboratory, University of California.*

Volume II : MESONS

by HANS A. BETHE and FREDERIC DE HOFFMANN

VOLUME I is a self-contained textbook of the modern development of field theory The presentation is simple and close to familiar concepts

Starting from a review of the one-particle relativistic wave equations, it proceeds to the subject of field quantization In this, the emphasis has been on the Feynman-Dyson graphical techniques for the S-matrix expansion. Renormalization theory is discussed in detail. In addition, an outline of very recent developments is presented

This material serves as background to understand meson phenomena, but it can be studied without reference to Volume II.

VOLUME II, which is essentially self-contained, will be of interest to both experimentalists and theorists It presents and analyzes the available experimental information in the field of meson physics Meson theory is treated both phenomenologically and from the field theoretical point of view

Experiments in the field of meson physics are discussed with particular stress on their interrelation and comparison with theory Results obtained by the use of high energy machines in such fields as meson-nucleon scattering and photoproduction are given in some detail Because of the particular importance of pi mesons, the largest fraction of the volume is devoted to a study of these However, sections on the mu meson and the "curious" new mesons, recently discovered, are also included.

The theory sections cover nuclear forces and the magnetic moment of the nucleon A "strong coupling" approach which has recently proved successful is given prominence. Volume I is not prerequisite to any of the phenomenological theory presented in Volume II, nor to most of the field theory

Volume II : Table of Contents (*contd*)

MACMILLAN BOOKS

Science and its Background

H D. ANTHONY, M A.(Cantab), B Sc , Ph.D.(Lond), F R.A.S.

Here is the story of science, with the background of history in which that story is set. Although most of the chapters centre around individual men of science whose work is of value to-day, the historical background is not only that of isolated biography but the continuous history of human affairs. Two chapters, on post-war developments and the pursuit of science for its own sake, have been added for this second edition. *Second Edition* 20*s*.

A Text-book of Electricity and Magnetism

G. R. NOAKES, M.A , F.Inst.P.

This is the new, Third Edition of a book which will meet the need of those taking Intermediate degree courses and the Advanced and Scholarship Examinations of the General Certificate of Education. All the usual topics required at this stage are dealt with, and where necessary calculus is used. Among the special topics discussed are the conduction of electricity through gases, atomic physics and modern views on ferro- and terrestrial magnetism. *Third Edition.* 14*s*.

Minerals for Atomic Energy

ROBERT D. NININGER

United States Atomic Energy Commission

This book, now published in this country for the first time, is sub-titled *A Guide to Exploration for Uranium, Thorium and Beryllium.* It is a complete handbook, covering the geology of these minerals, their incidence in America and elsewhere, their identification, the equipment to use in exploration, etc., and the evaluation of the results of successful searching. 55*s*.

Plane Algebraic Curves

E. J. F. PRIMROSE, M.A (Oxon.)

The aim of this book is to give the student who is unfamiliar with the theory of curves a reasonably brief introduction to the subject, there being no other elementary book still in print he should then be in a position to study the more advanced works. Though the book is intended for honours mathematics students at a university, the first few chapters could be studied with profit by advanced sixth-form pupils in schools 15*s*.

ANALYSIS OF DEVELOPMENT

BENJAMIN H. WILLIER, Professor of Zoology, Johns Hopkins; PAUL A. WEISS, Member, Rockefeller Institute for Medical Research; VIKTOR HAMBURGER, Professor of Zoology, Washington University.

735 pages. 248 figures 105s.

A work of great distinction which presents a summary of the present state of knowledge, and problems under investigation, of the stages of embryological development of animal organisms. Each chapter is written by a specialist with the editorial supervision of three eminent embryologists. *It is of great importance and outstanding authority.*

THE VERTEBRATE BODY

ALFRED SHERWOOD ROMER, Professor of Zoology and Director, Museum of Comparative Zoology, Harvard University.

New (2nd) Edition. 644 pages, 390 figures. 49s.

In preparing this revision of his successful book, Dr. Romer has been very alert to the comments made by fellow teachers of Comparative Anatomy. Approximately 2,000 changes have been made in the text and these have improved the overall clarity of the book.

The *Auto Camera* Mk.3

A VERSATILE RECORDING INSTRUMENT

Specially designed to cover a wide field of industrial and scientific work where the rapid production of high quality microfilms is required. It is eminently suitable for such purposes as instrument recording, photomicrography, oscillograph records, process timing, document copying, etc. It is fully automatic in its operation, the exposure and film transport being effected by a single electrical impulse operating on 12 or 24 volt d.c. Special daylight loading cassettes give a full 200 1″ × 1″ or 300 1″ × ¾″ exposures from one loading of 35 mm perforated film. The camera may also be controlled by manual operation

Write for 16-page illustrated brochure.

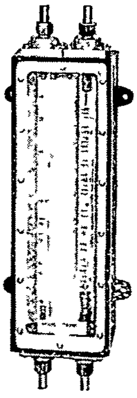
Measuring

Rate of flow

in analytical work



TYPE 842
Two-way

TYPE 704

The ready availability of accurate but inexpensive Rotameter flowmeters is greatly assisting the development of modern analytical techniques. A number of standard models specially designed for measuring small gas and liquid flows are now available, some of these (e g., Type 704) incorporating fine adjustment valves. Gas flow rates down to 2 ccs/minute are handled.

Applications are established in the following —

Gas Analysis — Absorption methods.
— Conductivity measurements.
— Infra-red radiation measurements
— Specific gravity measurements.

Chromatography . Micro Analysis . Flame Photometry (Burner and atomisation control) . Polarography

Write for Catalogue RP 2000/N which gives full details of the Rotameter range of flowmeters

with APIEZON products

Why users in 30 countries choose SOFNOL

non-hygroscopic SODA-LIME.

The up-to-date CO_2 absorbent for:—

★ AIR PURIFICATION in sealed compartments, confined spaces, underground and underwater working places, deep shelters, etc., etc., etc.
★ RESPIRATORS,
★ ANAESTHESIA APPARATUS,
★ OXYGEN ADMINISTRATION,
★ LABORATORY USES—metabolism determination, analytical work, etc.

because of its

★ HIGH ABSORPTION (25% to 40% by weight),
★ RESISTANCE TO ABRASION,
★ FREEDOM FROM HEATING,
★ NON-DELIQUESCENCE,
★ CONSTANT COMPOSITION (BP and USP),
★ LOW STERLING PRICE (No dollars to find).

SOFNOL non-hygroscopic SODA-LIME is supplied in WHITE, GREEN and VIOLET grades, the last two containing indicators which show by colour changes when the product is exhausted
Granule sizes 3/16 in to 14 B S.S. are standard Finer granules down to 30 B.S.S to order. Packed in sealed containers of 1 lb. to 28 lbs and in bulk
SOFNOLITE is the special, self-indicating grade for gravimetric CO_2 determination and general laboratory use. In 1 lb sealed bottles.

Colloidal Mo S_2

The name of ACHESON COLLOIDS LIMITED has been associated, for over 50 years, with the manufacture of colloidal dispersions of graphite and other solids Now to their well-known range of 'dag' dispersions, they add colloidal dispersions of molybdenum disulphide. This outstanding new lubricant is being applied with great advantage to :—

Die forging, drawing, extrusion and cutting of metals,
Lubrication in operations involving high pressure and temperature,
Dry lubrication.

If you are interested in these new developments or in the various applications of our range of products our technical staff will gladly discuss them with you.

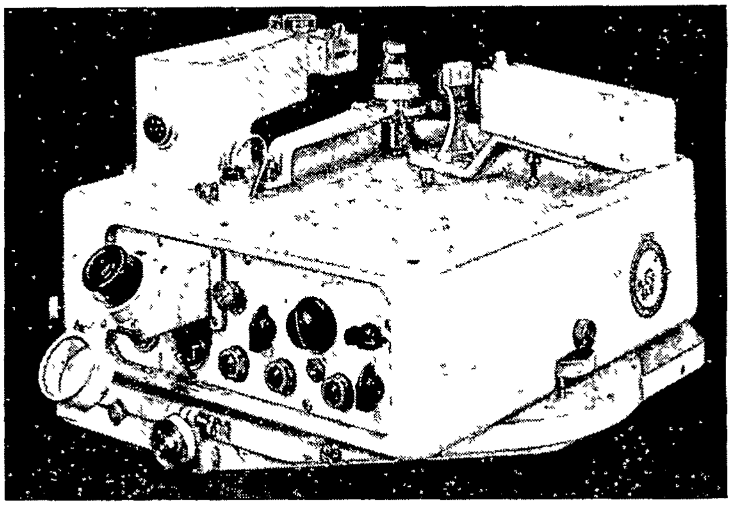
recording x-ray DIFFRACTOMETER

The Hilger Recording X-ray Diffractometer is designed for the qualitative and quantitative investigation of solid crystalline substances by X-ray diffraction methods without employing photographic processes. It records directly and rapidly the changes of intensity from point to point of an X-ray spectrum.



some of its important features are :

★ Built for use with non-regulated X-ray source.

★ High sensitivity combined with direct reading to 0.01° of 2θ by optical projection.

★ Scan range:
  continuous −10° to +160° of 2θ
  discontinuous—incremental steps over very small angles for exact investigation of weak diffraction lines.
  oscillatory—scan reversal mechanism providing automatic oscillatory motion of detector over arcs ranging from 2.5° to 125° of 2θ

★ Scan speeds—six speeds provided, namely, 2°, 1°, ½°, ¼°, ⅛°, 1/16°, of 2θ per minute.

★ Gearless 2 : 1 drive mechanism between sample holder and Geiger counter ensuring exactness of correlation of motions and freedom from backlash

★ Interchangeable fixed vertical slits.

★ Provision for analysis by fluorescence techniques

★ Three interchangeable specimen holders, indexed to the θ scale, available for Simple Powders, Integrating Types, Blocks.

★ Dual channel electronic control gear for pulse counting or continuous pen recording.

Member of the Scientific Instrument Manufacturers' Association and of SCIEX

year it was hoped to start the new joint building for aeronautics and for the further expansion of chemical engineering

The academic plan envisages a much greater rate of increase in the engineering faculty than in the science faculty, with a postgraduate increase of about 160 per cent and an undergraduate increase of about 44 per cent It is hoped to provide eventually for about fifteen hundred undergraduate and fifteen hundred postgraduate students, with perhaps half of the latter engaged in research With the aid of a modest increase in the recurrent grant for 1954–55 and the income from the American Counterpart Funds, it is hoped that the University of London will be able in the near future to appoint professors of applied science with special reference to engineering, soil mechanics, statistics, applied geophysics and heavy electrical engineering The new chair in heavy electrical engineering and the new readership in production engineering have been financed from sums available under the government programme for the expenditure of the Counterpart Funds, and it is expected that investment of the capital sum involved will make available about £8,000 a year The Cement Manufacturers' Association has covenanted for a second ten years to pay £2,000 a year to continue the chair of concrete technology, and some twenty-two companies are now contributing £200 a year each to the Building and Civil Engineering Contractors' Bursary Fund A number of seven-year covenants which will produce £2,300 a year have also given a new lease of life to the Nuffield Research Group in Extraction Metallurgy, apart from the permanent income of £500 a year eventually assured from the Imperial Smelting Corporation's Fund and the further £15,000 over five years provided by the Nuffield Foundation

The number of full-time students for the year under review was 1,727, compared with 1,653 in 1952–53, and, of these, postgraduate students in science and in technology numbered 223 and 349, respectively, compared with 225 and 314 in 1952–53 Of the full-time students, 111 were from foreign countries, 213 from Commonwealth countries outside the British Isles and 591 from the British Isles outside a radius of thirty miles from the College. Besides details of staff changes and the statement of accounts, a list of publications in 1953–54, arranged departmentally, is appended to the report

A SIMPLE METHOD FOR STUDYING AND DEMONSTRATING THE ENERGY CONSUMPTION IN FLYING INSECTS

By Dr OLAVI SOTAVALTA

Department of Zoology, University of Turku, Finland

RELATIVELY little information exists about the energy consumption in insects . what is available consists of observations on some single species of Hymenoptera, Diptera and Orthoptera only Beutler[1] gives data on sugar consumption in the honeybee, recorded on specimens in free flight in a *Flugaquarium* of glass. Wigglesworth[2] obtained energy consumption data of *Drosophila* by waxing the specimen to the head of an insect pin stuck in the cork of a glass vial, and stimulating it to flight by suddenly withdrawing the cork More or less elaborate flight-mills for studying various aspects of flight of insects, including energy consumption, have been built by several authors[3]

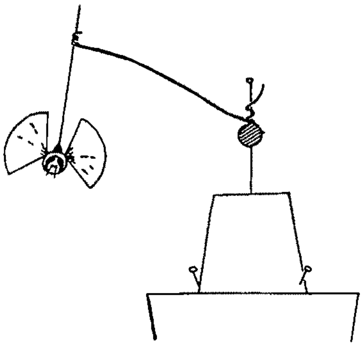

Fig 1

I have devised a method which was used for energy consumption studies on the honeybee, *Drosophila* and some other Diptera at Tufts College, Medford, Massachusetts, during 1952–53[4] It is a simplified flight-mill or 'roundabout' which consists of a metal wire of suitable length, rigidity and thickness, wound loosely by one end around an insect pin, so that it can rotate easily The pin is passed through a small ball of moulding clay to prevent the wire from falling down, and is stuck in a piece of cork (Fig 1) The other end of the wire is wound tightly around another insect pin head down, at its point end, and the insect is, under carbon dioxide or ether anæsthesia, waxed at its thorax under a binocular microscope to the head end of the pin The position of the insect in respect to the three axes of space is adjusted by bending the wire and by rotating the pin within the 'tight' wire coil In order to obtain an effective flight, the insect has to face the direction of the movement, with the long axis of the body horizontal If the body is vertical the movement may take place backwards

Insects mounted to the instrument usually start flying when the support (a piece of paper, or a cotton ball) is removed from under the tarsi If the insect refuses to start flying or stops by itself during flight, flight can be initiated easily by rotating the instrument backwards As soon as a tarsus touches an object, which may be a deliberately offered support or a part of the insect's own body, the insect stops flying

The quality of the wire and pin has naturally to conform to the size and powers of the insect Instead of waxing to the head of a pin, small insects can be conveniently glued to the uncoiled free end of the wire with a drop of 'Duco', 'Durofix' or other suitable cement, considerably thinned with acetone

This instrument is almost frictionless and easily rotated by the insect Few insects except *Drosophila* are willing to fly stationary attached to an immovable pin according to the method of Wigglesworth[2] , but a considerable number fly well in this kind of roundabout Honeybees and several other Hymenoptera are good subjects for experimenting, and flies that normally fly quietly, without sudden changes of speed, can also be used The lesser housefly (*Fannia canicularis*) is an ideal subject, while the common housefly (*Musca domestica*) and many larger flies are less satisfactory, since they generally fly in bursts and have to be stimulated to flight incessantly Once the flight has started, it can go on for hours until the insect is exhausted. While many insects consume all their energy in a relatively short time and are easy to exhaust, others have a considerable amount of reserve food in their body, and it is therefore difficult to exhaust them completely.

After a fresh insect has been flown to complete exhaustion, it is fed with a measured amount of sugar solution from a graduated micro-pipette. Standard capillary pipettes graduated in cubic millimetres can be used conveniently for larger insects, while internally waxed and calibrated pipettes of the Wigglesworth type[5] must be used for small insects. After a rest of some few minutes, the flight can be started and timed, until the insect is again completely exhausted.

The insects generally maintain a remarkable speed in the roundabout, and seven to eight revolutions per second is nothing unusual However, since the rigid wire supports the weight of the insect, all the work output is used for propulsion, and the speed observed in the roundabout therefore must not be equated with the speed of free flight of the species to be examined. RESISTIVITY IN METALS

Resistivity Changes by Plastic Deformation of Polycrystalline Metals

ANNEALED polycrystalline wires of 99 9 per cent purity copper and of 99 99 per cent purity silver, 93 mm. long and 0 5 mm in diameter, have been plastically deformed in extension and in torsion at 20° K and at 77° K , and their resistivity has been measured The apparatus used is depicted in Fig 1. Tension is applied to the specimen *F* immersed in liquid hydrogen or nitrogen through the spring *B* by moving the rod *A* upwards at a constant rate by means of a small motor. Elongation of the specimen is indicated by the pointer *C*, the force is deduced from the elongation of the spring, indicated by the pointer *D*. The wire can be twisted by means of the torsion head *E* , one complete turn corresponds to a shear strain of 0 017 at the surface The potential leads were soft-soldered to the specimen , resistivity was determined with a Diesselhorst potentiometer

First the wires were extended (to about 10 per cent), then a twist was applied (corresponding to a surface strain $\varepsilon_t \approx 0\ 1$), and afterwards the wires were extended further. In some cases a twist with subsequent extension was applied for a second time The relative variation of resistivity at the temperature of deformation as measured on several specimens has been plotted in Fig 2 Analysis of the curves yielded the following results

The extra resistivity depends on extension $\Delta l/l$ according to a power law

$$\Delta\rho_e = a(\Delta l/l)^p \qquad (1)$$

The exponent *p* differs from sample to sample. In most samples *p* lies between 1 2 and 1 4, once (copper at 77° K) *p* was found to be 1 7 The constant *a* amounts to about 0 06 μΩ cm , with a scatter of the order of 20 per cent, regardless of material or temperature Experiments by Druyvesteyn and Manintveld[1] on wires of copper, silver and gold at 77° K have yielded approximately the same results According to their observations *p* = 1 5 in all cases , *a* was comparable to our values[2]

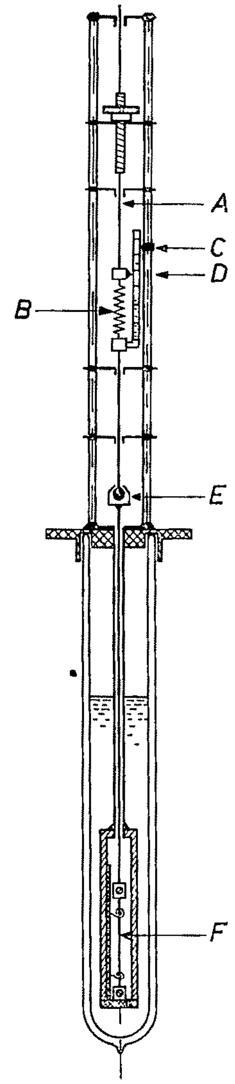

Fig 1 Schematic drawing of low-temperature deformation device

The resistivity increase on twisting is roughly proportional to the applied twist—it is about 0 04 μΩ cm at $\varepsilon_t = 0\ 1$, again, no definite dependence on material or temperature could be detected Reverse twisting has, apart from the first two or three per cent in ε_t, the same effect as direct twisting.

On subsequent extension again a power law of the form (1) is obtained, except for the first few per cent of strain The exponent *p* has remained remarkably constant , only the coefficient *a* has become greater by a 'multiplication' factor *m* which increases with the twist, and is about 1 3 for $\varepsilon_t = 0\ 1$, regardless of material or temperature

The extra resistivity of a plastically deformed metal must be attributed to dislocations or to point defects (vacancies and interstitials) or to both Assuming the dislocations to be formed by Frank-Read sources and the point defects by the effect of intersection of dislocation loops with dislocations already present in the material, the existence of a power law with exponent slightly greater than 1 can be shown to be in good agreement with the idea that point defects contribute to most of the resistivity rather than dislocations[2,3]. The dislocation density in the material after 10 per cent extension being certainly not higher than 10^{11} cm $^{-2}$, their influence on the resistivity should, according to calculations by Hunter and Nabarro[4], be less than $10^{11} \times 0\ 4 \times 10^{-14}$ μΩ cm $= 4 \times 10^{-4}$ μΩ cm in copper, while 3×10^{-3} μΩ cm was observed The density o point defects formed, taking d_0, the density o dislocations originally present, to be 10^8 cm $^{-2}$, i found, after 10 per cent extension, to be abou 10^{18} cm $^{-3}$. The resistivity increase by vacancies i copper was computed by Jongenburger[5] as 1 3 μΩ cm./per cent vacancies , that caused by interstitials is probably somewhat larger (see following com munication), namely, 5 μΩ cm./per cent inter stitials. Taking 3 μΩ cm /per cent defects as a mean value, the concentration mentioned of defects

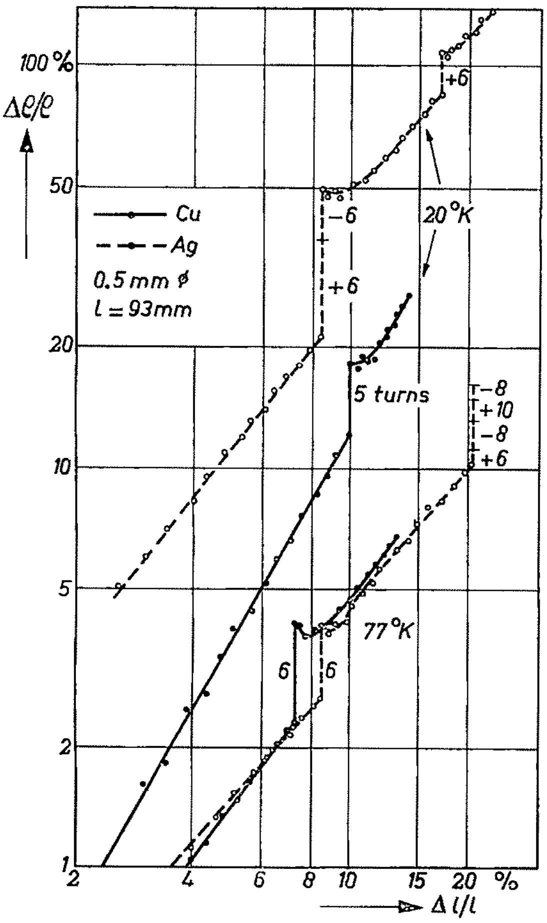

Fig 2 Relative increase of resistivity $\Delta\rho/\rho$ as a function of extension $\Delta l/l$ and of twist (expressed in the number of complete turns of the torsion head) for copper (full curves) and silver (dashed curves) wires A minus sign of the twist refers to reverse twisting

accounts for 0 003 $\mu\Omega$ cm. of the extra resistivity, which is in agreement with the observation

The results of the combined twisting and extension experiments seem to confirm these conclusions. A surface strain of 0 1 of the wire corresponds to the introduction of 1 3 $\times 10^8$ new dislocations per cm.[2] Their influence on the resistivity is, according to Hunter and Nabarro, only 0 5 $\times 10^{-6}$ $\mu\Omega$ cm, as compared to the observed increase of 0 004 $\mu\Omega$ cm. By the process of intersecting dislocations, point defects are also formed From the dimensions of the specimen and the applied twist, it is found that the number of defects formed is 5 $\times 10^{17}$ cm^{-3} at ε_t = 0 1, this results in an increase of resistivity of 0 002 $\mu\Omega$ cm, which is in much better agreement with observations

The occurrence of the multiplication factor m, rather than an additive effect on resistivity alone which remains constant on further extension, also points to the effect of point defects on resistivity as being by far the most important one The introduction of new dislocations, homogeneously distributed and of predominantly screw character, increases the rate at which expanding loops around Frank–Read sources form point defects in the ratio new density of crossing dislocations to old density d_0 (before the twist). However, the action of the sources is slightly impeded by the increase in dislocation density, and it can be shown[3] that one can put approximately $m = (d/d_0)^{3/4}$. From the observed value of m and the known number of newly introduced dislocations, d_0 can be computed It is found that $d_0 = 3 \times 10^8$ cm^{-2}, a reasonable value in view of the uncertainties of the theory.

The conclusion that point defects can be held responsible for nearly all the resistivity increase caused by plastic deformation of polycrystalline metals, and that the direct effect of dislocations plays only a minor part in this respect, seems, from the results of the experiments, to be warranted.

Extra-Resistivity due to Interstitial Atoms in Copper

SOME time ago we performed calculations on the extra-resistivity due to vacancies in copper, silver and gold[1]. When we tried to extend our calculations to the case of interstitials, this turned out to be much more complicated. Therefore, only a very rough estimation will be presented here, concerning copper

Theoretical arguments can be raised against the method used, but it finds some justification in the fact that it gives results of the correct order of magnitude in some cases, as will be shown below

Scattering of the conduction-electrons is caused by (*a*) the interstitial atom itself, and (*b*) the displacements of the neighbouring atoms The extra-resistivities due to these causes are supposed to be additive The free-electron approximation is used

(*a*) We represent the interstitial atom by a rectangular attractive field with radius a and depth U_0 As in the case of vacancies, we adjust U_0 in such a way that the asymptotic phase shifts α_l obey Friedel's[2] equation $\sum_l (2l + 1)\alpha_l = \pi/2$ Unfortunately, when performing this calculation for a number of a's, it turns out that the scattering area A varies much more with a than in the case of vacancies (Fig. 1) Taking a equal to r_s we find, but with a much greater uncertainty than in the case of vacancies, $\rho_a \sim$ 1 – 2 $\mu\Omega$ cm /per cent interstitials In passing, we remark that the use of an effective electron mass m^* instead of the free electron mass m gives essentially the same result if U_0 is again adjusted in the way indicated.

(*b*) The displacements of the neighbouring atoms were calculated by Huntington[3] In his configuration B we have 6 atoms with a displacement of 0 40 A and 24 atoms with a displacement of 0 13 A From this we find the mean of the square of the x-component of displacement for 1 per cent of interstitials in the following way

$$\overline{\delta^2{}_x} = \frac{1}{3}\,\frac{6 \times (0\ 40)^2 + 24 \times (0\ 13)^2}{100} = 0\ 0046\ \text{A}^2$$

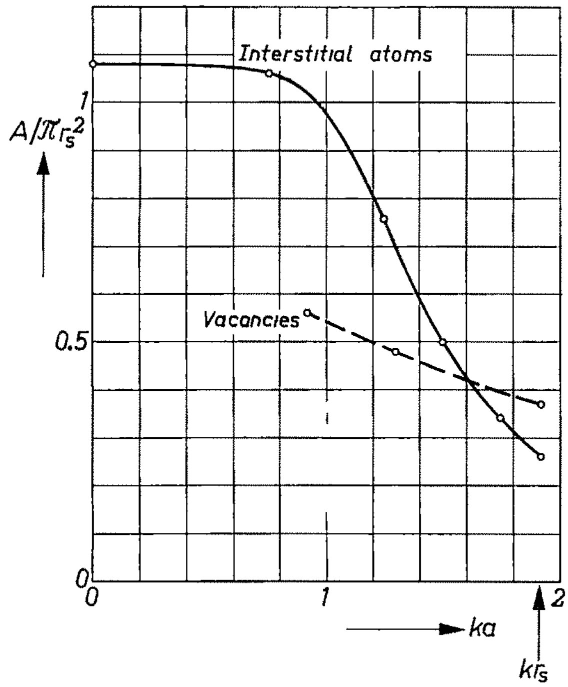

Fig. 1

The displacement of the copper atoms due to thermal motion at room-temperature is given by $\overline{\delta^2_{Tx}}$ = 0·0022 A². So the extra-resistivity due to the displacement of neighbours is estimated to be

$$\rho_d = \frac{0{\cdot}0046}{0{\cdot}0022}\, 1{\cdot}67 = 3{\cdot}5\ \mu\Omega \text{ cm./per cent interstitials}$$

Of course, this estimation is very crude, as the displacements due to the presence of an interstitial atom are not correlated with each other in the same way as the displacements due to thermal motion. But as the thermal resistivity itself can be estimated rather well without taking into account any correlation between the positions of the atoms[4], also in this case the order of magnitude will probably be correct. Moreover, the method works rather well in the case of a solid solution of carbon in iron. As is well known, this is an interstitial solution, the carbon atom being placed in the middle of the edges of the body-centred cubic cell. We assume that only the two nearest iron atoms are displaced, and that the extra-resistivity is only (or mainly) caused by these displacements, the carbon atom being neutral. Then from the observed extra-resistivity[5], following the method presented before, we find that the two nearest iron atoms are displaced 0·4 A. each. This is a reasonable value, the radius of the available site being 0·2 A. and of a carbon atom 0·8 A.

The extra-resistivity due to edge-dislocations can also be estimated on these lines; we find about the same value as Hunter and Nabarro[6].

We conclude, therefore, that also in our case we have made a reasonable estimation of the extra-resistivity due to the displacements; our result, however, is in striking disagreement with the calculations of Dexter[7], who concludes that the contribution of the displacements to the resistivity can be neglected. The cause of this discrepancy is not understood at present, but is probably caused by the transformation of his eq. (9) to (9′), which causes the scattering potential to be smeared out, thus lowering the resistivity considerably.

From (*a*) and (*b*) we conclude that the extra-resistivity due to interstitials is about 5 μΩ cm./per cent interstitials.

The fact that interstitial atoms have a much larger influence on the resistivity than vacancies (1·3 μΩ cm./per cent) is at least qualitatively confirmed by Overhauser's stored-energy measurements in irradiated copper[8], which gave a value of about 10 μΩ cm./per cent interstitials.

INDUCTION PERIODS AND IGNITION LIMITS IN SENSITIZED IGNITIONS OF HYDROGEN AND OXYGEN

By PROF. R. G. W. NORRISH, F.R.S., and
DR. P. G. ASHMORE
Department of Physical Chemistry, University of Cambridge
AND
PROF. F. S. DAINTON
School of Chemistry, University of Leeds

THE work of Hinshelwood and Thompson[1] upon the effect of nitrogen dioxide on the thermal reaction between hydrogen and oxygen was extended by Griffiths and Norrish[2] and by Foord and Norrish[3]. The success of Semenoff's treatment[4] of branched-chain reactions led Foord and Norrish to assume that the sensitized reaction is a simple branched-chain reaction and that the induction period (τ) is the time for the concentration of the chain centres (n) to reach a critical value (n_c). Hence, provided the net branching factor (φ) and the rate of initiation (θ) do not vary during the induction period, the expression for the latter is

$$\tau = \frac{1}{\varphi}\ln\left(1 + \frac{\varphi}{\theta}n_c\right) \qquad (1)$$

Also, it was frequently assumed that θ and φ are so related that variations in the logarithmic term are small, and τ was therefore regarded as being approximately inversely proportional to φ. This relation between τ and φ was used to make deductions about the properties of φ from the observed dependence of τ on certain experimental variables, and, when combined with the notion that explosion occurs when φ exceeds a critical value (φ_c) determined by the thermal capacity and the conductivity of the system, formed the basis of a reasonably satisfactory explanation of the main features of the sensitized ignitions with nitrogen dioxide[3,5] and with nitrosyl chloride[5].

However, it was recognized that two results frequently obtained by different observers[5,6] are at variance with this theory With constant pressures of hydrogen and oxygen, when φ_c is constant, it was found that (1) the value of τ at the higher sensitizer limit of ignition often exceeds the value at the lower limit, and (2) at low sensitizer concentrations τ frequently increases as the sensitizer concentration is increased and the system passes from a region of slow reaction to one of ignition If the relation $\tau\varphi$ equal to a constant is applied to these observations, then it must be concluded (1) that φ can have different values at the two limits, and (2) that φ can decrease in passing from slow reaction to ignition. The unsatisfactory nature of these conclusions needs no emphasis

The purpose of this communication is to indicate how these difficulties may be resolved by regarding the induction period as the time during which φ is progressively increasing, while retaining the condition that, if φ exceeds a critical value, explosion results The increase is brought about by the decomposition of the additive, which functions principally as a chain terminator, to yield nitric oxide, as the decomposition occurs partly by reaction of the additive with chain centres, and the nitric oxide can start fresh chains, there is a delayed chain branching. The view that "nitric oxide is the true catalyst . . whilst nitrogen peroxide is an inhibitor . . " was first adopted by Griffiths and Norrish[2] Because φ is changing during the induction period, equation (i) is now considered invalid.

The experimental evidence (Ashmore, *Trans Farad Soc*, in the press) for this view will be briefly summarized.

(i) In the same vessel at any particular temperature, the lower and upper limits of sensitizer for ignition are the same whether the original additive is nitrosyl chloride, chloropicrin, nitrogen dioxide, or a mixture of nitrogen dioxide and nitric oxide

(ii) On the other hand, the induction periods are shorter the more readily the original additive decomposes. For equimolar amounts of additive, the induction period with chloropicrin is less than that with nitrosyl chloride, which in turn is less than that with nitrogen dioxide

(iii) When the additive is placed in the reaction vessel before the reactants (rapid mixing being ensured, see Ashmore and Chanmugam[7]) the induction periods are shorter the longer the additive has been in the vessel, and they can become zero

(iv) If nitric oxide is introduced first into the reaction vessel, and the reactants added, instantaneous ignitions occur if the nitric oxide concentration is above a value which diminishes as the concentrations of the reactants are increased, however, there is no upper limit If a little nitrosyl chloride or nitrogen dioxide is mixed with the reactants, the upper limit reappears.

(v) When reactants containing nitrogen dioxide are added to a reaction vessel containing nitric oxide, keeping the total number of moles, nitric oxide + nitrogen dioxide, constant, there is a marked and regular decrease in the induction periods as the proportion of nitric oxide in the reaction vessel is increased This occurs throughout the ignition region and just above the upper limit.

(vi) There is now clear evidence from photometric work in progress at Cambridge that nitrogen dioxide disappears during the induction period for mixtures of hydrogen, oxygen and nitrogen dioxide admitted in the normal manner The concentration of nitrogen dioxide just before ignition is smaller the larger the initial concentration of nitrogen dioxide Near the upper limit, less than 5 per cent usually remains.

A kinetic scheme has been developed which includes the following reactions in addition to those believed to occur in the unsensitized hydrogen–oxygen reaction and in the molecular decompositions of chloropicrin, nitrosyl chloride, and nitrogen dioxide

$$H + NO_2 \rightarrow NO + OH \tag{1}$$

$$NO + O_2 \rightarrow NO_2 + O \tag{2}$$

$$O + NO_2 \rightarrow NO + O_2 \tag{3}$$

$$OH + NO_2 + M \rightarrow HNO_3 + M \tag{4}$$

$$H + NOCl \rightarrow NO + HCl \tag{4a}$$

$$HO_2 + NO \rightarrow NO_2 + OH \tag{5}$$

Hydrogen atoms from the main chain reduce nitrogen dioxide to nitric oxide by reaction (1), and in so doing produce the main-chain carrier OH The main chain is thus continued In addition, the nitric oxide generates an oxygen atom in reaction (2), and when this atom is not destroyed but reacts with molecular hydrogen, additional chains are started and therefore the rate of chain branching has been augmented Nitric oxide also increases φ by converting HO_2 radicals (which at the temperature concerned are not chain carriers but probably diffuse to, and are destroyed at, the wall) into hydroxyl radicals The additives themselves are chain terminators by virtue of reactions such as (4) and (4*a*) It is interesting to note that in all the reactions mentioned the integrity of the NO group is preserved. The remarkable effects of nitrogen dioxide and of nitrosyl chloride are due to the high dissociation energy of N—O and the relatively low dissociation energies of ON—O and ON—Cl.

An expression for the net branching factor φ has been derived, and its variation with concentration of nitric oxide and nitrogen dioxide studied If the condition for ignition is assumed to be that, whatever temporal changes φ undergoes during the induction period it does not attain the critical value φ_c (which may be zero or positive) until the end of the induction period, then the predicted changes in the induction periods and in the ignition limits are in very satisfactory qualitative agreement with those found experimentally for appropriate conditions of reactant pressure, pressure of additive, inert gas pressure and irradiation It seems likely that some quantitative relationships will follow from the photometric studies now in progress In the meantime, the evidence for the destruction of the additive as the cause of the induction period and for the absence of any simple connexion between φ and τ in these sensitized ignitions seems very strong [Jan 22

LETTERS TO THE EDITORS

The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Cephalosporin C, a New Antibiotic containing Sulphur and D-α-Aminoadipic Acid

A SPECIES of *Cephalosporium* produces a hydrophilic penicillin, called cephalosporin *N*, which yields D-α-aminoadipic acid on hydrolysis[1]. Crude preparations of cephalosporin *N* have been found to show strong absorption in ultra-violet light at 260 mμ, although highly purified cephalosporin *N* shows very little absorption at this wave-length A new antibiotic with an absorption maximum at 260 mμ has now been isolated from the crude preparations in the form of a crystalline sodium salt It resembles cephalosporin *N* in certain physical, chemical and biological properties, but differs from it sharply in others

Cephalosporin *C* sodium salt ($[\alpha]^{20}_{D}$ + 103° , λ_{max} 260 mμ, ε_{max} 9,500) separates from aqueous ethanol or aqueous propanol in monoclinic crystals Its equivalent weight, determined by titration, is 480 ± 15 X-ray crystallographic measurements were kindly made by Dr Dorothy Hodgkin and Mrs. M Mackay, who reported as follows unit cell dimensions $a = 13\ 12$ A , $b = 4\ 97$ A , $c = 17\ 82$ A , $\beta = 106° \ 30'$ Space group, $P2_1$, number of molecules in the unit cell, 2 , density, 1 38 The molecular weight, calculated from these figures, is 470 ± 15

On drying *in vacuo* at room temperature, cephalosporin *C* sodium salt loses two moles of water which are rapidly regained on exposure to laboratory air. The results of elementary analysis, together with the value for the molecular weight, indicate that a possible molecular formula for the crystalline hydrate is $C_{16}H_{20}O_8N_3SNa,2H_2O$, but this formula is only a provisional one and may need revision.

The infra-red spectrum of cephalosporin *C* sodium salt (in paraffin paste) shows bands at the following wave-lengths 2 94μ, 3 06μ. 5 61μ, 5 77μ, 6 05μ, 6 29μ, 6 57μ, 7 17μ and 7 36μ. It is of interest that a band in the region of 5 61μ is shown by the common penicillins and by cephalosporin *N*, and has been attributed in the former to the C=O of the fused β-lactam-thiazolidine ring system[2] The band at 5 77μ could be due to an ester or lactone grouping.

Cephalosporin *C* gives a ninhydrin reaction Electrometric titration indicates that it is a mono-aminodicarboxylic acid, having two acidic groups with *p*K values of 3 1 and <2 6 respectively and a basic group with a *p*K value of 9 8 When subjected to ionophoresis on paper in a collidine–acetate buffer at *p*H 7, it migrates towards the anode at almost the same rate as cephalosporin *N*

Unlike cephalosporin *N* and benzylpenicillin, cephalosporin *C* is stable in aqueous solution at *p*H 2 5 at room temperature It is rapidly inactivated, however, with loss of its characteristic absorption spectrum, at *p*H 12 After it has been kept in aqueous solution at *p*H 12 for two hours, back titration shows that two acidic groups per mole have been formed. Under similar conditions only one acidic group is liberated from cephalosporin *N* and benzylpenicillin

Cephalosporin *C* is not inactivated by penicillinase from *B. subtilis*, strain 569 [3]. It loses activity, though much less rapidly than cephalosporin *N* or benzylpenicillin, in the presence of a crude preparation of
penicillinase from *B cereus* (*NRRL* 569) The i
activation is accompanied by the liberation of a
acidic group and loss of absorption at 260 mμ I
appears to be caused by an enzyme other tha
penicillinase which is present in the preparation. Th
ratio (cephalosporinase activity/penicillinase activity
was much lower with highly purified penicillinase
from *B cereus* than with the crude material.

On hydrolysis with acid, cephalosporin *C*, lik
cephalosporin *N*, yields one mole of carbon dioxid
and D-α-aminoadipic acid The product obtained b
allowing cephalosporin *C* to react with 1 2 4-fluoro
dinitrobenzene yields, on hydrolysis, a substanc
which behaves like dinitrophenyl-α-aminoadipic ac
on paper chromatograms. It therefore appears tha
cephalosporin *C* contains a residue of D-α-aminoadip
acid and that the α-amino group is free The *p*K valu
of this group suggests that the α-carboxyl group
also free

An Infectious Nucleoprotein from Tobacco Mosaic Virus

WE have reported previously the degradation of tobacco mosaic virus in alkaline solution into a series of sub-units, of which the molecular weights could be determined in the ultracentrifuge. By reaggregation of these sub-units, we obtained a protein that had the same size and shape as the virus itself, but was not infectious[1]. Recently the process of degradation has been studied exhaustively by fractionating the products by electrophoresis. We carried out many experiments, varying the *p*H, the time of degradation and the temperature. We mention here only one ypical pattern obtained three hours after adjusting he *p*H to 10·3 at 0° C., which is reproduced in Fig. 1; t shows five different boundaries, of which Nu has he highest and IV the lowest mobility. Each fraction was isolated for study; the results are listed in Table 1.

Table 1. ELECTROPHORETICAL FRACTIONS OF TOBACCO MOSAIC VIRUS. 3 hr., *p*H 10·3, 0° C.

Fractions	Nu	I	II	III	IV	TMV
Mobility, ascending	−15·6	−12·7	−10·2	−9·2	−5·5	−9·2
Ribonucleic acid (per cent)	90	15	9	6	0	6
s_{20} in S, $c=0·4$ per cent	4·2	80–160		80–180	4·6	180
Infectivity	—	—	+	+	—	+

Fraction I contains 90 per cent ribonucleic acid nd 10 per cent protein. The sedimentation contant indicates a high molecular weight. Electronmicrographs show that the ribonucleic acid has a lamentous shape (Fig. 3). Fractions I and II conain more ribonucleic acid than the original virus. n the ultracentrifuge we found several definite comonents, which had smaller sedimentation constants han the original virus. Fraction III is identical with the original virus with regard to ribonucleic cid content, mobility and sedimentation constant, ut in the ultracentrifuge a small amount of material f lower molecular weight was also observed. Fraction V is a protein free of ribonucleic acid with a molecular weight of about 100,000. It is identical in all s properties with a natural by-product of virus reproduction that we isolated from virus-infected tobacco plants by the method of Takahashi[2]; in articular, we obtained the same intermediates and nal products in the reaggregation.

After prolonged exposure to *p*H 10·3, the nucleoroteins I and II were converted into ribonucleic cid and protein (IV). Fractions I and II may thereore be termed the 'labile fraction'. Surprisingly, fraction III does not disintegrate to protein and ribonucleic acid even after months at *p*H 10·5. It is therefore termed the 'stable fraction'. In different preparations of normal tobacco mosaic virus we always found the same proportion (30 per cent) of the stable fraction; but in a preparation of the Dahlemense strain the amount was significantly lower (12 per cent).

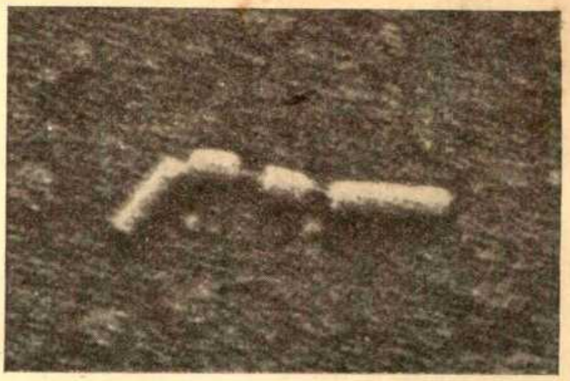

Fig. 2. Tobacco mosaic virus particles with gaps from fractions I+II. × 150,000

In the initial phase of the degradation the labile fraction and the stable fraction are both highly infectious in the local-lesion test with *Nicotiana glutinosa* and *Phaseolus*, whereas Nu and fraction IV are not infectious. After prolonged treatment, all components become inactive. By centrifugation of fractions I+II at 25,000 r./min. a fraction of high molecular weight was separated which had nearly the same infectivity per mgm. protein-nitrogen as the original virus. Since the ribonucleic acid content, the sedimentation constant, and the mobility show that this material is quite distinct from tobacco mosaic virus, we probably have for the first time a biologically active degradation product of the virus.

At the very beginning of the degradation protein appeared, but no ribonucleic acid. It is therefore probable that fractions I+II are formed from the tobacco mosaic virus by loss of protein, so that the ribonucleic acid content is higher than that of tobacco mosaic virus, a conclusion that is confirmed by the electronmicrograph. In fractions I+II we observed rods of tobacco mosaic virus with gaps, where only a thin filament, probably of ribonucleic acid, is to be seen (Fig. 2). Filaments of the same diameter can be seen on Fig. 3, where some rods are totally disintegrated to ribonucleic acid and disks of protein having the same diameter as the rods, a thickness of about 70 A., and a hole in the centre. We suggest that in the virus these disks are strung on a thread of ribonucleic acid. From the electronmicrographs we estimate the diameter of the filaments to be 30–40 A. at the most. If all the ribonucleic acid were concentrated in one strand of the same length as tobacco mosaic virus, the diameter would also be 30 A. The increased mobility of fractions I+II may be caused by the loss of protein, though other explanations are possible; but it cannot be due to the adsorption of ribonucleic acid on the intact virus particles, as we have been able to

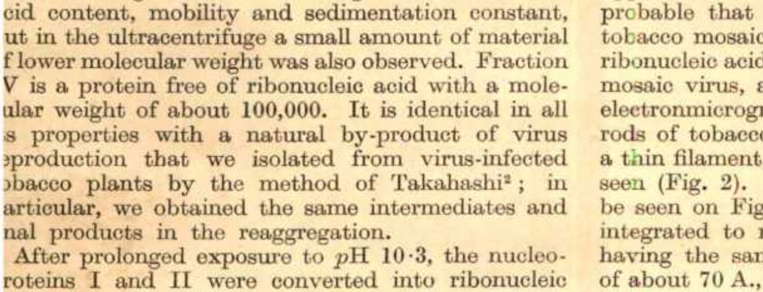

Fig. 1. Electrophoresis of disintegrated tobacco mosaic virus, descending boundary

Cellular Control in Virus Infection

Marked changes may be produced by virus infection in a host cell when the amount of virus material is very small compared with the amount of host cell and when some of the host's synthetic activities are altered by the presence of the virus. Many authors refer to this control of the cell by the infecting particle; but experimental evidence is very scanty. In infection by coliphage T_2, Cohen[1] has shown that infected cells use an alternative metabolic pathway to a greater extent than do normal cells. No definite information is available in mammalian virus infections as to the presence of such metabolic alterations, nor the means by which such changes could be produced.

In mouse liver infected with ectromelia virus at initial infecting levels of about 1 *LD* 50 per liver cell, the infectious titre drops to less than 1 per cent of the initial level and then returns to the initial titre at about 11 hr. The titre remains stationary until about 22 hr., when an increase of some thirty-fold occurs. It was suggested recently[2] that the eclipse period was concerned with establishing control of the cell before multiplication occurred. Evidence which supports this suggestion has been obtained by studying the effect of this virus on regenerating liver. It was found that at the same stage of regeneration there was a lower mitosis-rate in livers of mice infected 12 hr. previously than in livers of uninfected mice. For example, in young mice examined 40 hr. after partial hepatectomy, an uninfected group had a mitosis-rate of 6·7 ± 0·6, whereas a group infected for 12 hr. had an average mitosis-rate of 1·4 ± 0·3. Mice infected for longer periods show a more marked effect, mitosis being rare after 20 hr. of infection. In the first 12 hr. of infection, we have been unable to detect any abnormality in morphology or composition of liver, or any alteration in oxygen uptake, fructose utilization, or lactic acid production. The infectivity titre shows no virus multiplication at this time, and stays unaltered until about 22 hr. Complement-fixing antigen rises to detectable level at 12–14 hr. and increases in roughly linear fashion. Results of preliminary experiments show that the deoxyribonucleic acid per nucleus is the same in infected and non-infected cells at the same period of regeneration.

The control of mitosis appears at an early stage of infection, and is established at the end of the eclipse period, which appears to be the onset of time of multiplication of virus material. The time sequence suggests that the effect on mitosis may be closely related to the essential primary effect of the virus on the cell. The lack of other changes found in the liver after 12 hr. of infection makes the phenomenon less likely to be a secondary change, though they provide no lead as to the biochemical basis.

A further indication of disturbance of normal control is found later in the growth-cycle. In intact livers studied 30–40 hr. after infection, there is an increase in the amount of cytoplasmic material far greater than can be accounted for by virus. There is an increase in the ratio of cytoplasmic to nuclear volume and in the amount of protein per liver, without any increase in the amount of deoxyribonucleic acid. There is no increase in the number of cells.

As a working hypothesis, we consider that the alteration in cellular economy necessary for virus production, first indicated by control of mitosis, leads to the production of more cytoplasm, and this abnormal form of growth is followed by damage to the cell. Cellular damage is regarded, however, as a by-product of, rather than a prerequisite for, virus multiplication.

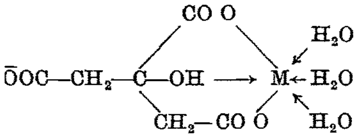
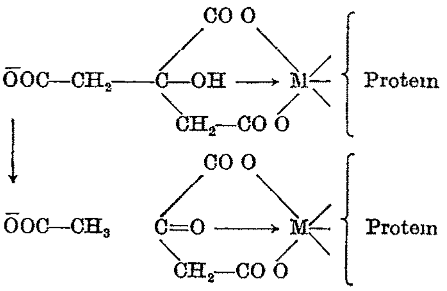
A Mechanism for Citrate Dissimilation

Certain bacteria dissimilate citrate anaerobically to acetate and oxaloacetate[1-4]; the reaction is of particular interest since, unlike citrate biosynthesis, it is not dependent on coenzyme A[1,2]. We have partially purified extracts of *A. aerogenes* and have demonstrated the following properties of citridesmolase: (1) As the reaction proceeds, the enzyme is progressively inactivated and ceases to function with citrate in excess. The amount of citrate decomposed is proportional to the amount of enzyme present (2) Oxaloacetate inhibits the reaction powerfully Acetate and pyruvate (a product of the action of crude preparations) do not (3) The enzyme is activated by certain divalent ions, notably magnesium, zinc and ferrous iron (4) Calcium ions do not activate, but they inhibit the action of magnesium ions competitively. Bobtelsky and Jordan[5] proposed the structure (I) for chelate compounds between certain divalent metal ions and citrate, and they demonstrated that the hydrogen atom of the coordinated hydroxyl group was labile On this basis a mechanism for citrate dissimilation by the enzyme is suggested (II)



(I)



(II)

The mechanism would account for the role of divalent metal ions in activation and competitive inhibition, and if there is a tendency for oxaloacetate to remain on the active site as shown, it would explain the observed inhibition by this product of reaction and the progressive inactivation that occurs. The asymmetric decomposition of the citrate molecule is a consequence of its three-point attachment It has been suggested[6] that a chelate compound involving ferrous iron and citrate participates in the aconitase system

We acknowledge assistance given by Mr J Sykes and Mr R G Stickland at a stage in this work.

Production of Pyruvate from 6-Phosphogluconate by Bacterial Plant Pathogens and Legume Bacteria

In the course of investigations on the metabolism of phytopathogenic and root-nodule bacteria, it was observed that certain species of the former, and all species tested of the latter group of organisms, produced pyruvate from 6-phosphogluconate, and from glucose-6-phosphate plus triphosphopyridine nucleotide Accompanying the formation of pyruvate was the appearance of triose phosphate These results suggested that the 6-phosphogluconate was being metabolized in a manner similar to that reported recently with *Pseudomonas saccharophila* by Entner and Duodoroff[1] and MacGee and Duodoroff[2], and with *P fluorescens* by Wood and co-workers[3] These observations were confirmed by the fact that the intermediate in this pathway, 2-keto,3-deoxy,6-phosphogluconate (kindly supplied by Dr MacGee, of the University of California, Berkeley, Calif) was also split by cell-free extracts of our cultures to pyruvate and triose phosphate

In these experiments cultures were grown in a fluid medium containing 1 per cent yeast extract and 2 per cent glucose in Fernbach flasks on a rotary shaker at 26° C The cells were harvested after 20 hr , washed twice in tap water and suspended in four times their wet weight in distilled water They were then subjected to sonic vibration in a Raytheon oscillator (10 kc /sec) for 5–10 min and the debris removed by centrifugation at 10,000 r p m for 10 min Pyruvate was determined either by the direct or by the double extraction methods of Friedmann and Haugen[4] and was further identified as the hydrazone by descending paper chromatography in a butanol–ammonia solvent, as described by Cavallini *et al.*[5] Triose phosphate was determined as alkali-labile phosphorus[6] Protein was estimated by means of the Folin phenol reagent as outlined by Lowry *et al* [7]

Representative species of the major groups of plant pathogenic bacteria were tested *Xanthomonas*, *Pseudomonas*, *Agrobacterium*, *Corynebacterium* and *Erwinia* All species of the first three genera were capable of carrying out the above reaction *Agrobacterium radiobacter* also gave a positive result. None of the species of *Corynebacterium* or *Erwinia* used (*C fascians*, *C flaccumfaciens*, *C. michiganense*, *E carotovora*, *E amylovora*) was found to split 6-phosphogluconate in this manner All species of *Rhizobium* studied (*R leguminosarum*, *R. trifolii*, *R meliloti* and *R phaseoli*) produced pyruvate from 6-phosphogluconate A summary of the results obtained with certain of the bacterial species tested is given in Table 1

Table 1 Production of Pyruvate from 6-Phosphogluconate
The reaction mixture contained 0 1 ml tris(hydroxymethylamino-methane) buffer *M*/1, *p*H 7 7, 0 1 ml *M*/20 6-phosphogluconate, 0 1 or 0 2 ml sonate, water to 1 ml , it was incubated at 35° C for 30 min and the reaction stopped by addition of 1 ml of a 0 1 per cent solution of 2,4-dinitrophenylhydrazine in 2 *N* hydrochloric acid

Organism	Pyruvate (*μM* per 10 mgm protein)
Xanthomonas phaseoli	4 0
Pseudomonas angulata	4 2
Agrobacterium rubi	3 0
Corynebacterium fascians	0
Erwinia carotovora	0
Rhizobium phaseoli	2 5
Rhizobium meliloti	1 8

The importance of this course of hexose phosphate utilization remains to be assessed For the species of *Xanthomonas* and *Pseudomonas* studied, it may be a major pathway, since little if any 6-phosphogluconate dehydrogenase activity has been demonstrated in sonates of these organisms as determined by measuring reduction of tri-(or di-)phosphopyridine nucleotide at 340 mμ in a Beckman *DU* spectrophotometer

Details of these experiments will be reported elsewhere. I am indebted to Dr W A Wood, of the University of Illinois, Urbana, Illinois, for suggestions concerning biochemical methods used in this work.

Inhibiting Effect of Trypan Blue on the Experimental Production of Liver Cancer

Recently, Gillman *et al* [1] and Simpson[2] reported that trypan blue injected subcutaneously into rats at weekly or bi-weekly intervals induced tumour (reticulum cell sarcoma) of the liver Trypan blue is a sulphonated dis-azo dye and somewhat resembles in chemical structure dimethylaminoazobenzene, which is a potent carcinogen for the liver of rats

The present communication deals with the results of the subcutaneous injection of trypan blue on the incidence and course of tumours induced by *p*-dimethylaminoazobenzene In these experiments 1–2 ml of a 1 per cent aqueous solution of trypan blue was injected subcutaneously at intervals of one to two weeks into rats of mixed breed weighing 80–100 gm which were also given 0 06 per cent dimethylaminoazobenzene diet The injections were continued until a total dose of 60–80 mgm of trypan blue had been given The control animals were given 0 06 per cent dimethylaminoazobenzene diet, but received no trypan blue The basal diet consisted of unpolished rice and contained 1 33 mgm of riboflavin per kgm , which encourages tumour induction and survival, and this was supplemented by green vegetables every two days The dimethylaminoazobenzene given to each rat amounted to about 600–700 mgm over a period of six to twelve months The experiments were terminated within one year and the incidence of liver cancer of the group injected with trypan blue was compared with the controls at periods of 6, 7–8 and 9–12 months after the commencement of the experiments

These results indicate that trypan blue delays the production of liver cancer by *p*-dimethylaminoazobenzene In the controls, the induced liver cancer reached a great size after six months and often metastases appeared in the abdominal lymph nodes and lungs In the groups of animals which received trypan blue for seven to eight months, the tumour incidence amounted to 33 and 100 per cent respectively , but these tumours were much smaller and more localized compared with the controls, in which the tumour incidence was practically 100 per cent During early trypan blue treatment, the rats showed less gain in weight and higher mortality due to respiratory infections than the controls, suggesting toxicity of the drug, while after five to six months they showed a considerable gain in weight whereas the controls showed a sustained loss

Histologically, a marked hepatic response could be observed in the liver of treated groups. During the first one to two months, the stellate cells in the liver sinusoids were large and plump, and filled with trypan blue particles, whereas in the later months of the experiment a characteristic proliferation of the histiocytic cells developed in the portal tracts with the stellate cells growing smaller and narrower. The hyperplasia and hypertrophy of the parenchyma cells of the liver, however, were more inhibited than in the controls

Recently, Miller *et al* [3] have shown that the levels of protein-bound carcinogenic azo-dyes in the liver are lower when the carcinogen is fed in diets containing high levels of riboflavin We measured the total protein-bound dimethylaminoazobenzene in the livers of the animals receiving trypan blue and in the control animals, using the method of Miller *et al.*[4] It was found that the difference in the two groups of animals was too small to explain the inhibiting effect of trypan blue *p*-Dimethylaminoazobenzene, however, was found in a slightly higher concentration in the trypan blue group, which suggests that trypan blue does not reduce the absorption of dimethylaminoazobenzene from the intestine or increase the rate of metabolism of it in the liver.

Determination of the Life of Human Blood Platelets using Labelled Di*iso*propylfluorophosphonate

Hitherto no satisfactory method for the determination of the life of blood platelets has been described Recently a method has been reported for determining the life of erythrocytes using di*iso*propylfluorophosphonate labelled with phosphorus-32 [1] This method was based on the irreversible combination of this compound with esterases present on the red cell membrane Since thrombocytes have also been shown to contain esterase, the same method suggested itself as a way of measuring the life of these cells It seemed reasonable to assume that conditions similar to those described for red cells would be met This implies that the decay of radioactivity associated with platelets would be entirely due to the destruction of these cells and therefore an index of their normal breakdown This would only be true if no re-incorporation of labelled material in newly formed platelets were to take place This assumption seems justified, since it has been shown that the only demonstrable metabolite of di*iso*propylfluorophosphonate in the human body is di*iso*propylphosphate. This compound is not further metabolized but quickly excreted in the urine The labelled di*iso*propylfluorophosphonate used was synthesized by Mr Oosterbaan (M.B L , Rijswijk) by a method to be reported in the near future

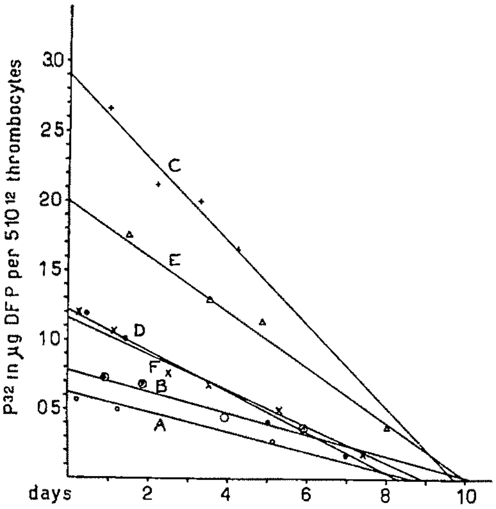

Fig 1

The labelled di*iso*propylfluorophosphonate was administered as before[1] From venous blood drawn into siliconized tubes using sodium sequesterene as anticoagulant, platelets were separated by a method of differential centrifugation Every care was taken to avoid any contamination of the final platelet suspension with other formed elements of the blood After determination of the cell concentration, the plasma was removed from a known volume of the final suspension The resultant platelet mass was washed three times with physiological saline and hydrolysed for 30 min at 100° C. in 3 ml. 30 per cent sodium hydroxide The volume was made up to 11 ml The radioactivity of this final solution was measured as described previously using a Geiger–Muller liquid counter By relating the measurements to controls obtained by alkaline hydrolysis of labelled di*iso*propylfluorophosphonate of known radioactivity, it was possible to determine the di*iso*propylfluorophosphonate content of the measured sample The same sample was used for the determination of the nitrogen content (Kjeldahl)

Measurements of platelet-bound radioactivity after injection of the labelled phosphonate was carried out at intervals in four normal persons (*A*, *B*, *C* and *D*), one patient with chronic myeloid leukæmia (*E*) and one patient with polycythæmia vera (*F*) The results are shown in Fig 1 The curves are drawn by the method of least squares The activity is expressed in micrograms di*iso*propylfluorophosphonate per 5 × 10^{12} platelets The results show that the decline of the activity follows a straight line, indicating the existence of a real life rather than random destruction The slope of the curve obtained suggests this life to be approximately nine days Similar curves are obtained when the activity is expressed per gram platelet nitrogen This figure might possibly be in some cases somewhat exaggerated due to contamination with radioactivity from other cells. This contamination reveals itself sometimes in a slight residual activity after the ninth day However, such activity is so small that it cannot account for an exaggeration of more than one day The life of the platelet should therefore be estimated at eight to nine days Large variation in radioactivity and in amounts of di*iso*propylfluorophosphonate used occurred in these experiments These facts suggest that toxic action or radioactivity does not seriously interfere with the life of the platelets under our conditions A more detailed account of the method will be published elsewhere

Plant Hyperplasia induced with a Cell-free Insect Extract

ALTHOUGH the mechanism of plant-gall formation by insects has long provided a field for speculation, there are few records of attempts to induce such growths experimentally The range of successful essays is practically limited to trials with Cecidomyid larval secretions and egg extracts in lanolin, injections of salivary gland extracts from a Coccid and *Adelges abietis*[1], and Martin's reproduction of pseudo-galls on sugar-cane with whole-insect extracts of a Jassid and other insects[2]

In the present experiments, Martin's technique was used in principle Mature larvæ of two generations of *Dasyneura urticae* Perris (Diptera Cecidomyiidae), which causes unilocular, slightly hairy galls on leaves, stems and flowers of *Urtica dioica*, were taken from sectioned galls and macerated in distilled water to give an extract of 50 larvæ/ml In a second series, only larval heads were used The macerate was filtered under slight vacuum, and the cell-free extract injected at once with an ultra-fine hypodermic needle into leaf bases of *U dioica*, using the three youngest leaves on each stem Attention has been directed[3] to the technical difficulty of directing the stimulus to the cambium , but it has also been held[4] that pre-existing meristems are not necessarily implicated in gall initiation, all cells having a reaction potential to stimuli

Out of a hundred and fifty injections with whole larva extract, and fifty with head-only extract, growth at the site of injection was noted within seven days in twelve and nine instances respectively, suggesting that the head provided the stimulant No growth occurred in fifty water-injected controls The growths did not resemble normal galls of *D urticae*, probably because of the short-lived impact of the stimulant The thickness of the parenchyma was increased by from two to five cells, with the epidermis consequently slightly raised Kataplastic hyperplasia was thus demonstrated, but no nuclear irregularities were observed (Longitudinal cell division has been described in *D. urticae* galls by Meyer[5]) No further growth occurred, nor was there subsequent reabsorption

Although the results do not resolve the problem as to whether gall formation is initiated by an insect secretion or by a plant response, they do show that cell division is promoted by a chemical present in fully grown larvæ of a host-specific Cecidomyid The zoological contribution to gall formation is therefore not confined to stimulants introduced at the time of oviposition or secreted only by newly hatched larvæ

A detailed account of this work will appear elsewhere, when studies with a prolonged stimulus have been completed

Colloid Osmotic Pressures of Dextran, Serum and Dextran–Serum Mixtures

THE polysaccharide dextran is widely used for expanding the plasma volume or augmenting the colloid osmotic pressure of patients in whom the total circulating protein is reduced No direct measurements have as yet been reported on mixtures of serum with dextran, although measurements made by Wales *et al* [1] on dextran–albumin mixtures are in conformity with the results described here.

Colloid osmotic pressure measurements have been made with a new instrument[2] which uses a mechano-electronic transducer to detect movements of very small volumes of fluid across a semi-permeable membrane In order to obtain reproducible results, it was found necessary to prepare nitrocellulose membranes which were substantially impermeable even to the smaller dextran molecules in the batch investigated With these membranes the osmotic pressure did not alter significantly between 30 min and 16 hr. When using membranes which were permeable to some dextran molecules but still impermeable to the serum proteins, it was found that the osmotic pressures, even on extrapolation back to zero time, might be considerably lower than those measured with the impermeable membranes This observation agrees with that of Grim[3], who used glucose and leaky nitrocellulose membranes

Fig. 1 shows the relationship between colloid osmotic pressure and colloid concentration for a transfusion batch of dextran ('Dextraven' batch 3525), normal human serum, and a mixture containing dextran and serum proteins in the ratio 43 to 57. The plot for dextran is sharply curved, so that only at low dextran concentrations can the colloid osmotic pressure be regarded as a simple function of the number average molecular weight (M_N) The plot for serum is less curved, and at low concentrations has a gradient similar to that of the dextran, that is, M_N for the two colloids is similar

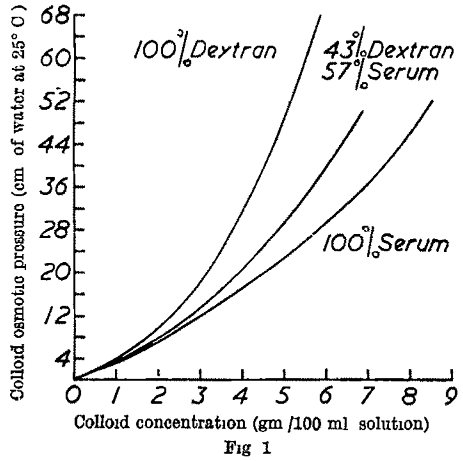

Fig 1

Table 1 CALCULATED AND OBSERVED COLLOID CONCENTRATIONS OF DEXTRAN–SERUM MIXTURES FOR VARIOUS COLLOID OSMOTIC PRESSURES

Colloid osmotic pressure (cm water at 25° C)	Dextran percentage of total colloid	Colloid concentration (gm /100 ml solution) Observed	Calculated
50 0	43	6 85	6 90
25 5	43	4 55	4 55
9 6	43	2 30	2 30
17 5	60	3 26	3 35
28 7	69 5	4 24	4 45
38 9	53	5 53	5 70
16 6	27 5	3 57	3 60
22 4	20	4 87	4 65
35 8	33 5	5 85	5 95

'Calculated' colloid concentrations of mixtures are derived from observed concentration curves of pure serum and pure dextran giving corresponding colloid osmotic pressures

Table 2 COLLOID OSMOTIC PRESSURE INCREMENT DUE TO PRESENCE OF DEXTRAN IN DEXTRAN–SERUM MIXTURES

Serum protein Concentration (gm /100 ml solution)	Colloid osmotic pressure (cm water at 25° C)	Increment in colloid osmotic pressure due to dextran concentration in mixture (gm /100 ml solution) 1 per cent	2 per cent	3 per cent	4 per cent	5 per cent
0	0	4	9 5	17 5	30	48
1	4	4 5	10 5	21	35	—
2	8	5 5	13 5	25 5	39 5	—
3	12	6 5	16 5	30 5	—	—
4	16 5	8	19 5	36 5	—	—
5	22	10	24	—	—	—
6	28 5	12	—	—	—	—
7	36	15	—	—	—	—
7 5	40 5	—	—	—	—	—

The curve for the dextran–serum mixture lies between those for dextran and serum , for any given colloid concentration the curve for the mixture (nearly half of which is dextran) indicates a colloid osmotic pressure much closer to the serum than the dextran. But inspecting the position of the curves for any given colloid osmotic pressure, the colloid concentration of the mixture is seen to have a value approximately midway between the corresponding dextran and serum values This finding encourages the view that calculations might be based, for any value of colloid osmotic pressure (p), on the expression

$$[\text{dextran}_p]\,x + [\text{serum}_p]\,(1-x) = [\text{mixture total colloid}_p]$$

where $[\text{dextran}_p]$, $[\text{serum}_p]$, etc , are the concentrations of dextran, serum, etc , giving an osmotic pressure of p, and x is the proportion of dextran in the final mixture. In Table 1 the results of a number of such calculations are shown which are in reasonable agreement with the corresponding experimental determinations

This expression has been used for calculating Table 2, which shows that doubling the dextran concentration at any serum protein-level more than doubles the osmotic pressure increment due to the presence of dextran, and also that the lower the serum protein concentration the less the increment of osmotic pressure from any given dextran concentration.

The number average molecular weight of the dextran cannot therefore be used to calculate the expected osmotic pressure increment, and, in fact, a 2 per cent dextran of M_N about 300,000 in the presence of 3 per cent serum proteins gave an osmotic pressure increment of 14 cm of water compared with 16 5 cm. of water for the transfusion batch of M_N about 80,000

These results indicate that the initial colloid osmotic effect of a given dose of dextran is likely to depend not only upon its number average molecular weight, but also upon its osmotic pressure/concentration curve and the concentration of the plasma proteins In addition, the permeability of the capillary walls may be such that the maximum possible osmotic pressure is not exerted across them even before much dextran has leaked into the extracellular fluid

Loss of dextran into the urine, which always occurs with the currently available preparations due to their content of low molecular-weight material, also complicates any attempt to make exact predictions of *in vivo* effects from *in vitro* measurements

I thank Prof J R Squire for his interest. Samples of dextran were generously supplied by Messrs. Bengers, Ltd, and Messrs Glaxo Laboratories, Ltd. This work was done during the tenure of a grant from the Medical Research Council

Separation of Flavins by Ion-Exchange Resins

Flavin compounds have been separated from each other by using a chromatopile[1], by using various kinds of adsorption and partition chromatography[2], and by chromatography on powdered cellulose[3]. A simpler and easier method using an ion-exchange resin is described in this communication

Using an anion-exchange resin, Cohn *et al* have reported the separation of adenosine and adenosine mono-, di- and tri-phosphates[4], and that of choline and its ester[5]

For the separation of flavin compounds by ion exchange, several ion exchangers were examined, and the anion-exchange resin, 'Dowex-1', was found to be the most suitable 0 5 gm of the resin of 100 ∼ 150 mesh was placed in a brown-coloured glass tube of 8-mm diameter, making a bed of depth 20 mm After conversion of the resin to salt-type, the aqueous solution containing a mixture of flavin compounds was passed through at a flow-rate up to 2 ml /min, and the flavins were adsorbed. Free riboflavin and flavin mononucleotide used in these experiments were chemically synthesized crystals, and flavin adenine dinucleotide was prepared from hog liver by the method of Warburg and Christian[6] and purified in a chromatopile[1].

The exchanger column was fractionally eluted with aqueous salt solutions at a flow-rate of 2 ml /min by changing the concentration of the salt in the solvent or changing both the concentration and *p*H of the solvent.

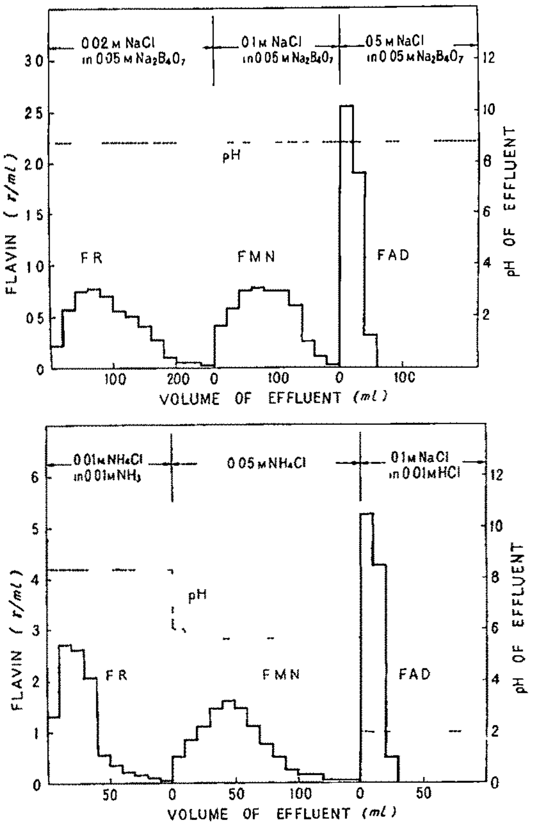

Fig 1 Anion-exchange separation of flavins bed, 'Dowex-1 × 4', 100 ∼ 150 mesh, 50 mm ² × 20 mm , flow-rate, 2 ml /min

The two fractional elution procedures were as follows (1) Change in the concentration of the salt. The resin was washed with 0 05 *M* borax (*p*H 8 8), and a solution containing 100γ each of riboflavin, flavin mononucleotide and flavin adenine dinucleotide in 0 05 *M* borax (*p*H 8 8) was adsorbed on the resin. Riboflavin was obtained on elution of the resin with 0 05 *M* borax containing 0 02 *M* sodium chloride, flavin mononucleotide with borax solution containing 0 1 *M* sodium chloride and flavin adenine dinucleotide with borax solution containing 0 5 *M* sodium chloride

(2) Change in the concentration of salt and *p*H of the solvent. After the resin has been washed with 0 01 *M* ammonium chloride in 0 01 *M* ammonia aqueous solution (*p*H 8 4), and the solution of 100γ of each of the flavins dissolved in the above-mentioned solution was passed through, riboflavin was not adsorbed and immediately obtained as the initial effluent Then, from the flavin mononucleotide and flavin adenine dinucleotide adsorbed, the former was obtained on elution of the resin with 0 05 *M* ammonium chloride at *p*H 5 6, and the latter with 0 1 *M* sodium chloride in 0 01 *M* hydrochloric acid at *p*H 2 0

In these experiments, flavin compounds were identified by paper chromatography[7] and the quantities present determined by the lumiflavin fluorescence method[8] The results are shown graphically in Fig 1 These graphs show that the flavin compounds were separated completely from each other, and that the methods described can be applied for the fractional determination of the nucleotides of riboflavin and the purification of flavin adenine dinucleotide

Circular Chromatography of Terpenes on Adsorbent Coated Glass

THE 'chromatostrip' method of Kirchner, Miller and Keller[1] for the separation and identification of terpenes and related compounds is a useful technique in a field where chromatography has been little applied The method consists essentially of coating glass strips with an adsorbent (silicic acid), oven-drying and cooling *in vacuo* over potassium hydroxide The oil is spotted near one end of the strip, which is developed by capillary ascent in a similar manner to paper strips. Spots or zones are located by spraying with reagents, one of the most useful being concentrated sulphuric acid, with which most components of essential oils give characteristic colours. Kirchner *et al* have indicated the usefulness of the method for two-dimensional chromatography, and Reitsema[2] has used glass plates on which a number of oils were directly compared.

In this laboratory the method has been adapted to the circular technique first described by Rutter[3] and has resulted in better resolution of zones, with the added advantage that as many as six oils may be conveniently compared on one plate 'Magnesol' (hydrated magnesium silicate) has given better results than silicic acid

Circular glass plates (5½ in. diameter) are coated with the adsorbent in a similar manner to that described by Kirchner *et al* [1], except that 'Magnesol' is used instead of silicic acid The plates are dried for ½ hr. at 105° C and cooled for ½ hr under vacuum over potassium hydroxide The plate is then spotted at its centre with the oil to be examined, and placed adsorbent side down over a 5-in diameter Petri dish containing a few millilitres of solvent. In the centre of the Petri dish a 1/16-in diameter cotton wick, held upright by passing it through a hole in a metal support, feeds the solvent on to the plate at the oil spot A wooden jig is used for centring the wick and the plate accurately The movement of the solvent can be seen through the glass and the position of the solvent front is marked with a glass pencil on the upper side of the plate When measuring R_F values, the adsorbent is scraped off the glass above the pencil marks Rate of development is controlled by the diameter of the wick and its degree of contact with the plate About thirty minutes development gives good resolution for a radius of 2¼ in from the point of contact.

The method has proved most useful in comparing the essential oils of hybrid *Eucalyptus* species with those of the parent trees

Inverted Rhythmic Precipitation

MANY examples of rhythmic precipitation occur in geological and biological formations, where the separation of the rings of precipitate (of copper carbonate, calcium phosphate, etc) decreases with the direction of diffusion of flocculating solution, and these have not generally been considered true cases of the Liesegang phenomenon[1]. The laboratory techniques[2,3] that are generally used for the study of rhythmic precipitation *in vitro* have always led to the typical spacing relation, for X_{n+1}, the position of the $(n + 1)$th ring,

$$X_{n+1} = (d_n - d_0) = ak^n \qquad (1)$$

where d_0, d_n are the distances of the first and $(n + 1)$th ring from the origin of diffusion[4]. With such techniques, X_n always increases geometrically with n, as the concentration of coagulating ion gradually decreases along the diffusion path[3,5] When the diffusing ion, on the other hand, acts as a peptizer, no precipitation is observed

I have developed a new technique for obtaining inverse rhythmic precipitation, similar to that observed in many natural formations The ammonia-peptized sol of an insoluble metal salt dispersed in a fluid gelatine suspension is coagulated by diffusing a mixed solution of acetic acid, together with a third peptizing ion of slower rate of diffusion, into the set gel (cf ref 6)

The concentration of peptizer is greatest at planes nearest to the origin of diffusion, and the separation of the rings now decreases with n.

The following results have been obtained with 0 005 M silver chromate sols peptized by 0 050 N ammonia, in 5 per cent dialysed gelatine gels. 1 c c. of the mixed solution was diffused into 15 c c of gel contained in test-tubes, and the precipitation observed for six to eight days. Measurements of d were made with a cathetometer[3].

Peptizing cation. (i) Precipitation with acetic acid plus copper nitrate solution Over the range of concentrations, 2 N – 0 5 N acetic acid, 0 5 N – 0 1 N cupric ions, silver chromate is precipitated as a normal series of rings[6], followed at the plane A (Fig 1), about 2 cm from the origin of diffusion (O), by a series of rings of large silver chromate crystals These rings become closer together along the diffusion path, and at a plane B, at distance d_∞ from O, a band of flocculated precipitate is formed The distance (X_n) of the nth ring from A is now given by the relation,

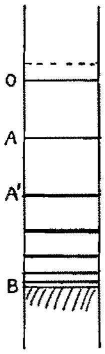

Fig 1

$$X_n = (d_\infty - d_n) = ak^{-n} \qquad (2)$$

where a and k are constants. d_n is the distance of the nth ring from O (as in equation (1)) a has now a geometrical significance, and is equal to AB, the separation of the first two rings. Values of d_∞, a and the spacing coefficient $(k - 1)$ are given in Table 1

Table 1 INVERSE PRECIPITATION OF $M/200$ SILVER CHROMATE

	d_∞	a	$(k-1)$
2 *N* Acetic acid			
plus 0 5 *N* cupric ions	4 2 cm	2 0 cm	0 234
0 2 *N* ,, ,,	2 7	0 8	0 100
0 1 *N* ,, ,,	1 5	<0 2	<0 020
N Acetic acid			
plus 0 2 *N* cupric ions	fully peptized		>1 000
0 1 *N* ,, ,,	4 0 cm	1 7 cm	0 450

(ii) Precipitation with acetic acid plus lead nitrate solution The usual rings of silver chromate first formed by the rapidly diffusing acetic acid are in turn gradually changed into rings of lead chromate which form by displacement (unpublished work) These latter are then peptized by excess lead ions After 16 hr, a system of inversely stratified lead chromate precipitate appears on a background of yellow sol, over the range *N* – 0 1 *N* acetic acid, 0 5 *N* – 0 1 *N* lead ions

The rhythmicity is not sufficiently clear for accurate observations to be made without photoelectric instruments

Peptizing anion (iii) Precipitation with acetic acid plus potassium iodide solution As in (ii), the silver chromate first formed is displaced by rings of silver iodide, which are in turn peptized to form an inversely precipitated system of pale yellow silver iodide rings on a background of silver iodide sol. For this system, also,

$$X_n = ak^{-n}$$

Values of d_∞, a and $(k - 1)$ are given in Table 2.

Table 2 INVERSE PRECIPITATION OF $M/100$ SILVER IODIDE

	d_∞	a	$(k-1)$
5 *N* Acetic acid			
plus 0 5 *N* iodide ions	6 0 cm	3 0 cm	0 670
0 2 *N* ,, ,,	4 6	2 0	0 462
0 15 *N* ,, ,,	3 4	1 0	0 380
2 *N* Acetic acid			
plus 0 5 *N* iodide ions	5 5 cm	2 4 cm	1 000
0 2 *N* ,, ,,	3 4	1 5	0 591
0 15 *N* ,, ,,	1 4	0 6	0 305
N Acetic acid			
plus 0 5 *N* iodide ions	4 7 cm	1 7 cm	1 424
0 2 *N* ,, ,,	2 9	1 0	0 825
0 15 *N* ,, ,,	0 9	0 4	0 440

As in Table 1, with increase in the initial concentration (C_0) of peptizer, $(k - 1)$, a and d_∞ all increase with fall in initial concentration of acetic acid, the total extent of diffusion of the coagulant, and hence that of the silver chromate precipitation, decreases d_∞ and a thus decrease, but since more free ammonia will now be present at any plane, the spacing coefficients still increase[6]

For any initial acetic acid concentration, $(k - 1)$ varies with the value of peptizer concentration, according to the relation,

$$(k - 1) = \overline{A} - \overline{B}/C_0 \qquad (3)$$

(see Fig 2)

$\overline{A}$ is the spacing at infinite initial peptizer concentration, and increases inversely with concentration of acetic acid (C_{HAc}) The variation of $(k - 1)$ with concentration of acetic acid at constant initial concentration of peptizer, indeed, follows the general relation, obtained for normal rhythmic precipitation[3],

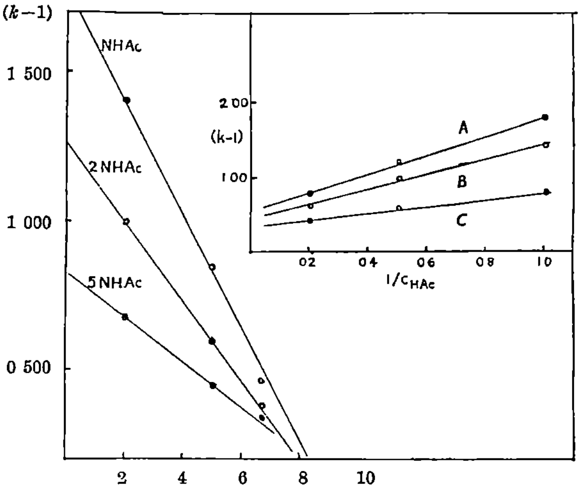

Fig 2 Curve A, $\infty NI'$, curve B, 0 5 NI', curve C, 0 2 NI'

$$(k - 1) = A + B/C_{\mathrm{HAc}} \qquad (4)$$

(see Fig 2).

The above work was carried out at the Department of Physical Chemistry, King's College, London, during a period of postgraduate research I wish to thank Sir Eric Rideal for his interest and helpful discussion.

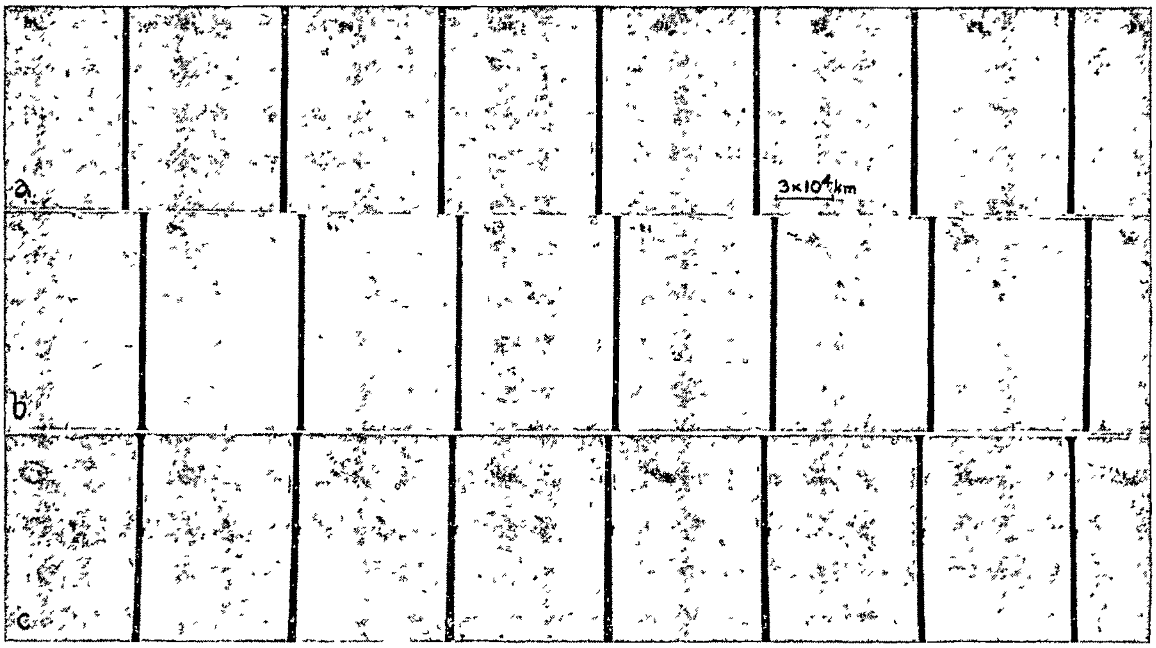
Intensity Variation in Sunspots

IN view of the observations of Dr. R. Ananthakrishnan[1] and his remark concerning the reality of the brightening of that part of the penumbra of a sunspot which is adjacent to the umbra, the attached print is of interest

These photographs were taken on August 11, 1954, and are part of a ciné record of a sunspot group made between 14 15 and 14 30 U.T The light-sensitive material was Eastman 548-*GH* emulsion coated on 16-mm base Exposure was made with a Bolex camera, without lens, situated at the focus of a 6-in aperture, 480 in focal length horizontal refractor No filter was used, so that the spectral range recorded is from the ultra-violet cut-off of the optical equipment (about 3000 A) to the limit of the sensitization treatment of the emulsion (about 5700 A). The frame-rate of the motion-picture camera was 8 per sec, so that each strip has a total duration of one second, with the time increasing from left to right in each case The shutter speed for each frame was 1/70 sec

Strip (*a*) was taken very early in the series and shows very little penumbra and very little brightening immediately surrounding the umbra Strip (*b*) was exposed about two minutes after (*a*). This strip shows



an abnormally bright region surrounding the umbra which is soon obscured or obliterated by the rapidly forming penumbra Strip (*c*) was exposed about one minute after (*b*) Here the brightening next to the umbra is very much enhanced and appears to be almost the size of the penumbra, which is still well developed The brightened area appears to be in violent motion. The speed shown by the 'flare' in frame 5 of (*c*) is of the order of 50,000 km per sec, which would seem to prove that this is due to excitation rather than motion of material

I have been unable to obtain solar noise records for 2,700–3,000 Mc/s. for the time during which the photographs were made Some H_α flare activity was noted in this region during this time, but, to my knowledge, none occurred while the pictures were being taken

This work was supported, in part, by the U S. Army Signal Corps, under Contract No. *DA*36-039-*sc*-64524

Germanium in Power Station Boiler Plant

CRAWLEY[1] has reported the results of a search for germanium in the waste products of the major coal-burning industries of Britain We have determined the quantity of germanium in more than sixty samples of dust and deposits taken from various types of steam-raising plant within the British Electricity Authority, the results have not been encouraging

In boilers fired with pulverized fuel, nearly all the ash from the fuel is carried forward with the flue gases, and it is therefore unlikely that appreciable enrichment of germanium will occur in the fly-ash. Analysis of several samples of fly-ash confirmed that the germanium content was very low, and even ash which had remained in the plant for some time, for example at the base of the chimney, was found to contain only 0 01 per cent When the fuel is burned in a stoker-fired furnace, however, only a few per cent of the total ash in the fuel is carried forward and some enrichment due to condensation or adsorption on the fly-ash might be expected. The maximum concentration found in such ashes was only 0 015 per cent

Selective condensation of inorganic constituents of the coal causes deposits to be formed in varying quantities throughout the boiler It has been found that many of these deposits contain more germanium than the coals from which they were derived, but in only two, both from the superheater, was the germanium content greater than 0 1 per cent, which is the minimum concentration likely to repay recovery The maximum concentration found was 0 16 per cent Amounts between 0 05 and 0 1 per cent were found in ten out of forty samples of deposit taken from various parts of the system, including the induced-draught fans. The remainder of the deposits contained 0 003–0 05 per cent It appears from these figures that deposits from steam-raising plant only occasionally contain useful amounts of germanium Even then, the quantities of these deposits available are usually small, at most, about a ton could be recovered with some difficulty from one boiler in a year

If the conditions of combustion and the constituents in the coal which affect the release of germanium could be determined, it might be possible to forecast which boilers were likely to have deposits rich in germanium. Experiments are therefore being made to see whether pyrites and the chlorides of sodium and potassium affect the release of germanium during the combustion of coal.

Longitudinal and Screw Vibrations of Beams

RAYLEIGH'S method has been applied recently by us to examine the modes of vibration of beams and the relationships between the modes One result of some interest is the interference with the fundamental modes of two types of oscillation which we have called 'screw vibrations' These vibrations, although simple in nature, are generally ignored, perhaps because they have a minimum frequency of excitation.

Travelling waves in a circular cylinder can be distinguished, when the wave-length is considerably greater than the diameter, by the nodal surfaces, or the nodes in a normal cross-section. The fundamental modes of oscillation without nodes are the longitudinal and torsional modes In addition, there are harmonics with nodal cylinders at a distance from the axis, and there are vibrations with nodal planes which cut the axis (there are other harmonics with both types of node) The first and second vibrations with nodal planes are the flexural and screw vibrations respectively.

If the z-axis is along the axis of the beam, and the axes OX, OY are principal axes of inertia of the normal cross-section with radii of gyration b, a respectively, then the displacements for the two screw vibrations from our approximate theory are

$$\text{(i)}\ u = \mathrm{A}\,x\sin(kz-\omega t),\ v = -\mathrm{A}\,y\sin(kz-\omega t),\ w = 0$$

$$\text{(ii)}\ u = \mathrm{B}a^2y\sin(kz-\omega t),\ v = \mathrm{B}b^2x\sin(kz-\omega t),\ w = 0$$

for long wave-lengths The name 'screw vibrations' was given since this seemed to describe the motion fairly well It is also clear from (i) that the motion can be alternatively described as a squeezing motion, where the rod is squeezed first along the x-axis and then along the y-axis, and that (ii) can be described in the same way if the axes are rotated through 45°. For a circular or square beam these two vibrations are identical, but they are not for a rectangular or elliptical beam

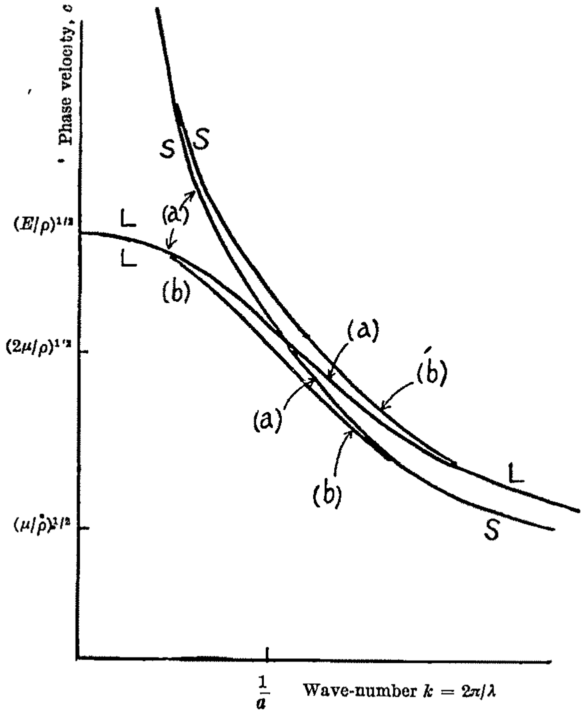

Fig 1 Interference of longitudinal and screw vibrations L = longitudinal type, S = screw type (*a*) Circular or square beam, (*b*) elliptical or rectangular beam

The importance of these vibrations lies in the fact that they interfere with the longitudinal and torsional vibrations. In our approximate theory, as shown in Fig 1, the dispersion curve of a circular cylinder for the longitudinal vibration cuts that for the screw vibration (i), when the phase velocity is $\sqrt{2}$ times the shear-wave velocity Being of the same symmetry, the two interfere for a rectangular or elliptical cylinder. The result is that the fundamental mode, believed to be longitudinal, changes its character from longitudinal to screw as the wave-length passes through a value equal to the diameter of the beam, and the excited mode changes from screw to longitudinal These conclusions have now been verified by exact calculations They seem to be the first true example in this field of coupling between oscillations, the coupling constant being a shape parameter

Evidence that this transition actually takes place is at the moment limited, but it should be easy to verify It certainly agrees well with the observations of Morse[1] who, trying to excite longitudinal vibrations, found it much easier to obtain the higher branch at high frequencies. Also Mr. A. B Lewis, in the Physics Department of this College, has been observing longitudinal vibrations using lycopodium powder and has found in one or two cases that the powder, instead of being distributed in rings about the axis of his cylinder, has lain in spirals at some places

The second screw vibration (ii) interferes in the same way with the torsional oscillation The approximate theory gives the interference without an actual intersection of the curves, but this intersection has since been found by Mr A Green, of this Department, in the course of some exact calculations of the torsional oscillations of non-circular beams

In view of the simple form of the oscillation, it should be possible to devise an elementary or engineering theory of the screw oscillation; but this has not yet been done.

An Interferometer for 'Straightness' Measurement

IT is sometimes required in engineering practice to measure the flatness of a surface, such as that of a surface plate, with considerable accuracy. A similar problem arises in checking the straightness of a mechanical motion, such as that of a lathe cutting-tool To perform such a measurement with sufficient accuracy is not easy if the dimensions are too large to allow of an optical flat being used as a reference surface

An interferometer has been constructed which enables such measurements to be made The optical system, shown in Fig 1, is based on two identical concave mirrors, separated by their common radius of curvature, so that the centre of curvature of each lies in the face of the other. The reference 'straight' is then defined by the line joining the two centres

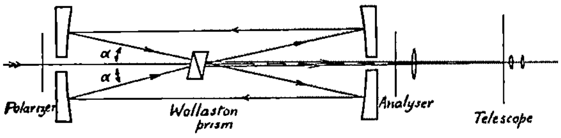

Fig 1 Optical system of 'straightness interferometer'

of curvature Light enters through a small hole in one mirror, and proceeds along the axis until it strikes a beam-splitting device, which may conveniently be a Wollaston prism It is thereby divided into two beams which, after successive reflexion at the two mirrors, converge on to the prism once more. It is easy to show that this is the case for any axial position of the prism Each beam is then refracted once more, and the two beams pass through a hole in the second mirror in a direction parallel with the axis and with each other, but separated by a small amount

If the original beam be polarized at 45° to the principal directions of the prism, and an analyser placed in the beam upon its emergence from the system, interference fringes will be observed in the focal plane of a telescope These fringes will move if the Wollaston prism be displaced at right angles to the axis in the plane of the diagram, but will not move for a displacement in any other direction. If the angle made by each beam with the axis be α, and the wave-length be λ, the displacement of the prism for a motion of one fringe of the fringe system will be $\lambda/(4 \sin\alpha)$

In use, the prism may be mounted on a moving member of which it is desired to check the straightness of path, or suitably attached to a stylus which moves over the surface to be examined The motion of the fringes then indicates the deviation of its path from the line of centres of the mirrors

It is convenient to introduce a compensator to return the central white fringe to a fiducial mark in the eyepiece at each measuring point The deviations are then read from a scale on the compensator

An experimental model, using mirrors 3 in in diameter and 20 in apart, with a prism giving an angle α of about 0 06, gives a sensitivity of about 0 00008 in per fringe, allowing a reading accuracy, if the compensator be set to one-tenth of a fringe, of about 8 micro-inches It is found that successive runs are repeatable to about this figure.

The spherical aberration introduced by the two mirrors is not negligible but, because of the symmetry of the system, it does not give rise to any error.

Effect of Time of Embryo Formation on Quantitative Characters in *Drosophila*

In preliminary studies on the causes of variability in pure lines of *Drosophila melanogaster*, using the quantitative character of sternopleural chæta number, it was noted that a relationship existed between chæta number and time of hatching This could have been due entirely to changes taking place in the culture media[1,2], but experiments have now shown that some part of this variability is already determined before the eggs are laid and is, furthermore, inherited

Pairs of flies taken from the Samarkand line, which has been sib-mated for more than three hundred generations, were transferred at 12-hr intervals through a relay of six tubes to remove effects of staling media The curve obtained on summing the results of several experiments repeated at different times ('Samarkand relay', Fig 1) differs from the type of curve produced when no relay is employed, but may be related to the changes found by Robertson and Sang[2] to occur in the physiological activity of the female with advancing age. On taking several pairs of flies at 12-hr intervals from an ordinary culture tube, and maintaining separate lines for three generations by mating flies from the respective hatching periods, the combined family means curve ('Samarkand time selection', Fig 1) was found to be closely correlated with that of the 'Samarkand relay' From this it appears that the variability determined prior to egg-laying is inherited, but, as one might expect, the response to environmental effects in the tube is not Hence selection within an inbred line is possible.

The curve may be altered by taking parents, or grandparents in the first instance, from different hatching periods If, therefore, parents are taken at random in replicating experiments of this nature, seemingly inconsistent results may be obtained, thereby leading to a conclusion of random variation. Oregon, a more prolific and long-lived inbred line, gives the same type of curve, but it is interesting to note that the curve is more pronounced and drawn out over the longer life-span On this account alone Oregon must be considered a more variable line.

Under certain summations, chæta number shows a negative correlation with the number of flies hatching, but the relation is not complete and in some cases it may be positive Should this be substantiated by further experiments, then it would appear that factors (presumably cytoplasmic) responsible can segregate independently of each other

Age of parents has been shown to influence the character of the offspring in a number of organisms,

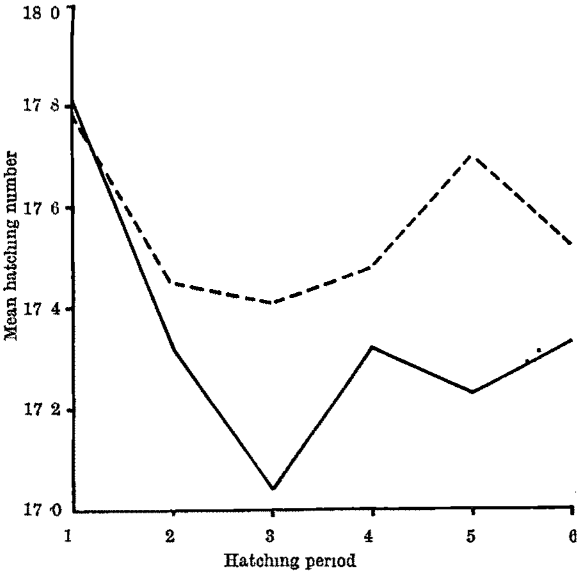

Fig 1 Samarkand relay, ———, Samarkand time selection, - - - -

and recently Mather[3], in reviewing a symposium[4] on the subject, directs attention to the significance of those findings. Some further points of immediate interest follow. (i) A large part of the variability in at least two inbred lines of *Drosophila*, generally ascribed to residual heterozygosity or uncontrollable environmental variation, is governed by the time of embryo formation. In common with the lower organisms, *Lemna*[5], *Philodrina*[6] and *Aspergillus*[7], there is here an extra-chromosomal mechanism of inheritance. (ii) Greater emphasis must be placed on good sampling technique in taking flies for examination or mating. Taking flies from a set period is not advisable, since the time-effect not only varies with lines but also shows some interaction with generations. (iii) The use of an inbred control for removing some of the environmental variability from selection lines may increase their variability, since if the controls (*c*) and selection lines (*s*) are independent, or $V_c > 2W_{cs}$, then $V_{c-s} > V_s$. (iv) Stability of genotype, in the sense that it is normally applied, cannot be considered a complete interpretation of the relative variability of inbred lines and their crosses. It remains of considerable interest to assess how much may be apportioned to this.

The Covering Reaction in a Tropical Sea Urchin

IT has long been known that certain littoral echinoids habitually cover the parts of their body that are exposed to light by fragments taken from their surroundings. Some have interpreted this as a concealing reaction, or, in part at least, as a response to strong light, or as a defence against desiccation and temperature extremes resulting from exposure at low tide; others remained non-committal. *Lytechinus variegatus* (Lamarck) shows the response in striking fashion[1] and, in Jamaica, in habitats where it is never exposed by tides. The response has been examined in these laboratories.

The individuals found in Jamaica differ noticeably in the depth of the green colour of the test and spines, pale and dark forms being present in about equal numbers in the populations I have examined. Both avoid strong light (especially the pale forms), either by seeking shade or by covering themselves with opaque fragments; if the shade or the material available for cover is scanty, both methods are employed. Naked forms transferred from shade to sunlight may begin to cover themselves in about two minutes and complete the process in about five minutes. In intense sunlight, the process is continued until the urchin is buried in the hole excavated by the removal of stones, shells, etc., used to form the cover.

The response has been ascribed to the activities of tube feet and pedicellariæ[2], but I find no evidence of the latter taking part, each fragment being pulled down firmly against the tips of the spines by the tube feet attached to it. The number of tube feet involved depends on the weight of the object held, and if it is slightly displaced, additional tube feet are brought into play to hold it. These co-ordinated actions are still performed when the areas including the peristome or the periproct, and the lantern, together with all nerve elements associated with them, have been removed.

Light is a significant factor, since when it is directional, opaque objects are held against the source, and if the position of the latter is altered, the shading objects are moved accordingly. A shadow cast on the aboral or ambital regions produces a brief and rapid shortening of some tube feet, which then extend more slowly toward the shading object, adhere to it and hold it in the light path.

The covering is shed slowly and to varying degrees as the light intensity is reduced. In total darkness, a complete covering may be shed in 70 min.–3 hr., but in some cases, one or two stones have been retained for as long as 19 hr. When light is re-admitted, the covering is picked up again with a speed which depends on the light intensity, the time the urchin has remained in darkness and its depth of colour (pale individuals covering themselves more quickly and more completely than dark ones).

A process of physiological adaptation may occur; urchins which have been compelled to remain uncovered in strong light cease to show the response, but may show it again after a sojourn in darkness.

The importance of light is shown by the effect of dyes such as eosin *Y*, bengal rose and neutral red, which, when dissolved in sea water or cœlomic fluid and injected into the perivisceral cœlom, photosensitize urchins so that they cover themselves in relatively dim light. The effect appears in 2–20 hr. and persists for four to seven days.

The work is being continued and will be published in full elsewhere.

Breeding Systems and Compatibility in *Glyceria*

A LIMITATION of gene exchange by incompatibility between segments of an outbreeding species-population is of primary importance in micro-evolution[1], and few cases have hitherto been reported in the Gramineae. Some results of a study of the species *Glyceria fluitans* and *Glyceria plicata* may therefore be of interest.

From both species, five widely separated local populations, each distinguished by minor morphological characters, were selected for intensive biosystematic investigation. Seed samples were collected by a suitable method[2], and the progeny grown in the experimental garden. All the plants had the somatic chromosome number $2n = 40$ usual in these species[3,4].

Table 1 BREEDING SYSTEMS AND COMPATIBILITY IN *Glyceria*

	G fluitans								*G plicata*							
	Selfed		Open pollinated*		Crosses within populations		Crosses between populations		Selfed		Open pollinated*		Crosses within populations*		Crosses between populations

Mean seed viability (per cent) (Heavy + light)	54		88		54		1 7		92		83		95		86	
Range (per cent)	2–90		87–90		50–58		0–21		82–100		65–97		90–100		80–95	

* Data from two populations only † Heavy seed grains of full size ‡ Light seed grains less than two-thirds full size

Tests were carried out to determine self- and cross-compatibility within and between populations. Hand emasculation followed by 'automatic pollination' was adopted in making crosses[5] Compatibility was assessed on the basis of seed-set and viability

A varying degree of self-incompatibility from plant to plant is characteristic of outbreeding grasses[6] Comparing the results obtained from selfing with those from uncontrolled outcrossing (Table 1), it can be seen that *G. fluitans* plants are to various extents self-incompatible This is shown by the low percentage of heavy seed obtained on selfing. Seed viability is related to degree of self-incompatibility, germination being poorest in the most self-sterile plants. *G plicata* plants are by contrast highly self-compatible

Observations were made of behaviour at anthesis. In *G fluitans* the florets opened briefly and the large pendulous anthers were fully exserted on long filaments prior to dehiscence, which occurred before the stigmas were fully expanded. The florets of *G plicata* stood open, and the small anthers were borne out on rather stiff filaments, dehiscing above the fully expanded stigmas. These facts strongly suggest that *G. fluitans* is a predominantly outbreeding species, and *G plicata* generally inbreeding In the latter species, though pollination is required for seed setting, apomixis may occur to some extent.

The results of controlled hybridization indicate that, in *G. plicata,* plants derived both from the same and different populations are highly cross-compatible By contrast, in *G fluitans* the results of intra- and inter-population crosses differ markedly

Seed set in intra-population crosses (62 per cent heavy seed) about equalled that obtained on outcrossing (67 per cent heavy seed), there was, however, some reduction in viability, 54 per cent as against 88 per cent on outcrossing.

In inter-population crosses, few or no seeds were set (1 2 per cent heavy seed) and the viability of these was poor (1 7 per cent)

This suggests that a degree of incompatibility exists between parts of the *G fluitans* species-population, sufficient to limit or prevent gene-exchange In both species the local populations sampled were distinct morphologically and perhaps equally well isolated from the micro-evolutionary point of view Incompatibility occurs in *G fluitans*, but is apparently absent from *G. plicata*, and this is probably related to the breeding systems of these species[7]

This work forms part of a biosystematic study of the British species of Sect. Euglyceria carried out at the University College of Leicester, the results of which will be given in full elsewhere.

Arginase in Elasmobranch Muscle

Hunter and Dauphinee[1] demonstrated the presence of arginase in the voluntary muscle of the dogfish (*Squalus sucklii*) and also possibly in the muscle of the herring In the course of another investigation, it has now been observed that this is not true of other elasmobranchs, since no arginase activity was found in the skeletal muscle of the common skate (*Raja batis*), thornback skate (*R clavata*) or cuckoo ray (*R circularis*) using the conditions of determination of Van Slyke and Archibald[2] with the colorimetric procedure of Engel and Engel[3]. Activity was, however, observed in both the ordinary 'white' skeletal muscle (0 3 arginase units[2]/mgm extract nitrogen) and 'red' lateral-band muscle (0 75 arginase units/mgm. extract nitrogen) of the lesser-spotted dogfish (*Scyliorhinus caniculus*) (cf the observations of Matsuura *et al*[4] on several non-elasmobranch species of fish).

It seems that for the rays, at least, the extra-hepatic regulation of urea which appears to occur in elasmobranchs cannot take place in the muscle, even though this tissue is rich in urea

APPOINTMENTS VACANT

Applications are invited for the following appointments on or before the dates mentioned

Lecturer or Senior Lecturer in Mathematics, and a Lecturer or Senior Lecturer in Science, at the Royal Military Academy, Sandhurst—The Secretary, Civil Service Commission, Burlington Gardens, London, W 1, quoting 4434/55 (March 31)

Metallurgists (with a university degree or equivalent qualification in metallurgy, and preferably with experience in the behaviour of metals at high temperatures) in the Research Laboratories, British Electricity Authority, Leatherhead—Director of Establishments, B E A, Winsley Street, London, W 1, quoting AE 579 (March 31)

Biochemist (non-medical) in the Department of Chemical Pathology—The Secretary, Royal Free Hospital, London, W C 1 (April 1)

Senior Lecturer (with special qualifications in inorganic and analytical chemistry) in Chemistry, a Teacher of Chemistry, a Teacher of Science, and a Teacher of Mathematics—The Principal, College of Technology, Belfast, N Ireland (April 1)

Assistant Lecturer or Lecturer in the Department of Zoology—The Registrar, The University, Liverpool (April 2)

Organic Chemist (preferably with experience in the structural chemistry of natural products), to assist in the investigation of the structure of certain hormone-like substances of plant origin—The Secretary, National Institute for Research in Dairying, Shinfield, Reading, quoting 55/5 (April 2)

Senior Lecturer (with at least an honours degree in metallurgy of a British university or equivalent, together with substantial experience in research or industry) in the Department of Metallurgy, to be responsible for teaching advanced physical metallurgy to honours B Sc (metallurgy) and A I M standards, and to participate in the postgraduate and research work of the Department—The Registrar, College of Technology, Suffolk Street, Birmingham 1 (April 2)

Lecturer in Mechanical Engineering, at the College of Technology and Commerce, Cardiff—The Director of Education, City Hall, Cardiff (April 5)

Principal Lecturer or Senior Lecturer in Radar and Telecommunications or Electronic Instrumentation, a Lecturer in Mechanical Engineering, a Lecturer in Electronics at the Royal Military College of Science, Shrivenham—The Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W 1, quoting S 4439/55 (April 7)

Assistant Veterinary Investigation Officer (Member of the Royal College of Veterinary Surgeons, and with experience of general veterinary practice among farm animals, and preferably with laboratory experience)—The Secretary, West of Scotland Agricultural College, 6 Blythswood Square, Glasgow, C 2 (April 9)

Experimental Officers and Assistant Experimental Officers (with at least H S C (science) or equivalent) at the Ministry of Supply National Gas Turbine Establishment, near Farnborough, Hants, for problems of combustion, heat transfer, aerodynamics, projects and performance instrumentation, and application of electronics in gas turbine research—The Ministry of Labour and National Service, Technical and Scientific Register (K), 26 King Street, London, S W 1, quoting C 146/5A (April 9)

Lecturer (preferably with research experience in polymer science) in Chemistry—The Registrar, The University, Manchester (April 9)

Lecturer (with experience in electron microscopy) in Biophysics—The Registrar, The University, Manchester 13 (April 11)

Lecturer (with a good degree in engineering and some industrial experience, and preferably some experience in engineering design) in the Department of Mechanical Engineering—The Registrar, The University, Liverpool (April 13)

Chair of Anatomy at the University College of Khartoum, Sudan—The Secretary, Inter-University Council, 1 Gordon Square, London, W C 1 (April 15)

Lecturer in Experimental Physics, Lecturers (2) in Electronics, Assistants in Experimental Physics, Theoretical Physics, and Electronics, and a Lecturer in Agriculture—The Secretary, The University, Aberdeen (April 15)

Director (with veterinary qualifications and preferably a good degree in science) of the Animal Health Trust Farm Livestock Research Station, Stock, Essex—The Scientific Director, Animal Health Trust, 14 Ashley Place, Westminster, London, S W 1 (April 18)

Physicists or Mechanical Engineers (with a good honours degree in physics or mechanical engineering, considerable experience in research, and with scientific originality and initiative), with the National Coal Board, Isleworth, Middlesex, to lead teams being formed for the investigation of the technical processes of coal winning—The National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S W 1, quoting TT/943 (April 18)

Lecturer or Assistant Lecturer (with a special interest in organic chemistry) in Chemistry—The Registrar, The University, Sheffield (April 23)

Assistant Lecturer in Mathematics—The Registrar, The University, Hull (April 25)

Chemist (with an honours degree in chemistry (biochemistry or agricultural chemistry) of a British university, and some research experience)—The Director, Tea Research Institute of East Africa, P O Box 91, Kericho, Kenya (April 30)

Lecturer (Grade I) in Chemical Engineering, at the University of Queensland, Australia—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (April 30)

Lecturers in Experimental or Theoretical Physics—The Secretary of University Court, The University, Glasgow (April 30)

Assistant Lecturer in Physics—The Registrar, University College of North Staffordshire, Keele, Staffs (May 1)

Senior Lecturer in Plant Taxonomy, at the University of Cape Town, South Africa—The Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1 (May 10)

Assistant, Grade "B" (with graduate or A R I C qualifications) in Chemistry—The Principal, Technical College, Queen Street South, Huddersfield

Assistant Lecturer (with special interests in plant pathology) in Agricultural Botany—The Bursar, Royal Agricultural College, Cirencester

Assistant Technical Secretary (male or female) (with a general science degree or equivalent qualification, and preferably with experience in metallurgical analysis, metallography or physical testing) in the Metallurgy Division at the Association's London offices—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W 1, quoting "Assistant Technical Secretary"

Graduate (with an honours degree in chemistry or metallurgy) to undertake research in the methods of preventing corrosion of iron and steel—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W 1, quoting "Corrosion"

Head (with appropriate academic and industrial qualifications) of the Department of Chemistry and Biology, College of Technology and Commerce, Cardiff—The Director of Education, City Hall, Cardiff

Laboratory Technician (with some knowledge of chemistry and experience in general workshop practice) whose main duties will be to take charge of Metallurgical Stores, and to prepare samples for laboratory classes—The Registrar, The University, Nottingham

Laboratory Technician (with general and chemical laboratory experience, and preferably some botanical experience)—Professor of Botany, The University, Edgbaston, Birmingham 15

Lecturer (with a good honours degree in metallurgy and preferably works experience) in Metallurgy—The Registrar, The University, Nottingham

Lecturers (2) in Mathematics—The Secretary, Royal Technical College, Glasgow

Senior Lecturer (specializing in stratigraphy–palæontology) in Geology—The Dean, College of Arts and Science, Baghdad, Iraq

Chair of Physics, and Chair of General Chemistry, at the Royal College of Medicine, Baghdad, Iraq—The Director, Personnel Department, The British Council, 65 Davies Street, London, W 1

LECTURES AND COURSES

MIDDLESEX COUNTY COUNCIL EDUCATION COMMITTEE

ACTON TECHNICAL COLLEGE
HIGH STREET, ACTON, W 3
Principal J Topping, M Sc , Ph D , F R I C , D I C

DEPARTMENT OF CHEMISTRY AND BIOLOGY
Head of Department J H Skellon, T D , M Sc , Ph D , F R I C

The following Special Courses will be held during the Summer Term 1955 (1) Production and Utilization of Glyceride Oils and Fats Fridays, April 22 to July 18, 1955 7 30 p m Lecturer, Dr J H Skellon F R I C To include Survey of important natural fats Fat utilization Methods of extraction and refining Fat structure and its bearing on utilization Edible oils and fats Special uses Fats in the soap industry Oils in the paint and varnish industry The course is intended for industrial chemists, research workers and others engaged in industries utilizing oils and fats and related compounds Fee for the Course, £2 2s (2) A special three-day Laboratory Course on Paper Chromatography Wednesday, Thursday, Friday, April 13 14 15, 1955 Lecturer, I Smith Esq , B Sc , A R I C To include Experiments in ascending, descending and circular paper chromatography Types of paper Location reagents Comparison of spray, dip and other methods of applying reagents to chromatograms Multiple dipping procedures Desalting techniques, etc Special applications in the organic and biochemical field Suitable for industrial chemists and analysts wishing to acquire training in new analytical techniques Fee for the course, £2 2s

Further particulars and forms of application may be obtained from the Principal

C E GURR
Secretary to the Education Committee

SIR JOHN CASS COLLEGE

JEWRY STREET, LONDON, E C 3
Telephone No ROYal 3383

The College prepares students by full-time, by part-time day and evening courses in Botany, Physics, Mathematics, Geology Chemistry, Zoology for the intermediate examination and the B Sc general degree of the University of London for internal and external students and for the examinations of the Royal Institute of Chemistry, of the Institution of Metallurgists, and of the Institute of Physics Full-time and part-time courses are also held for the B Sc internal and external special degrees in chemistry, in mathematics and in physics, and for the B Sc (Eng) metallurgy degree There are full-time courses for the London external special degrees in botany and in zoology Facilities are provided for research and postgraduate study and short courses of lectures are held on a variety of special topics Research Assistantships (£350 per annum) will be awarded in September, 1955 About six Bursaries, each of £40 per annum, are available to students in attendance at the college

Applications for enrolment for the Academic Year 1955-56 may now be made on forms to be obtained from the Secretary

---

COLLEGE OF AERONAUTICS

The Board of Entry of the College invites applications from suitable candidates for the two-year course which begins in October, 1955, and ends in June, 1957 Candidates should be of graduate standard, although the possession of a degree is not essential , a good higher national certificate is an acceptable standard The College, a postgraduate institution, is devoted to the study of aeronautical science and engineering The curriculum covers the five main subjects of Aerodynamics, Aircraft Design, Aircraft Electrical Engineering Aircraft Propulsion and Aircraft Economics and Production Instruction in the first year is designed to provide all students with a broad background of knowledge in all these subjects, with opportunity for limited specialization in two or three of them In the second year, students specialize more particularly, usually in one subject Experiments in the air are an important part of the work, both in the first year when all students take part in them and in the second year when they are linked to the specialist work of the departments Students who satisfactorily complete the course will receive the Diploma of the College

Further particulars and details of the procedure for enrolment may be obtained from The Warden, The College of Aeronautics, Cranfield, Bletchley, Bucks

---

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

DEPARTMENT OF CHEMICAL ENGINEERING

The following courses of ten lectures each will be given on Monday afternoons commencing April 25, 1955 "The Principles of Flame Structure, Shape and Stability in Flowing Gases" by Dr F J Weinberg "Combustion in Internal Combustion Engines" by Mr N P W Moore, Mechanical Engineering Department

Further particulars from the Deputy Registrar, City and Guilds College, Exhibition Road, London, S W 7

UNIVERSITY OF LONDON

A lecture on "Specific Inhibition of Adrenergic Responses" will be given by Professor Mark Nickerson (Manitoba) at 5 p m on March 30 at St Thomas's Hospital Medical School, Albert Embankment, S E 1

Admission free, without ticket

JAMES HENDERSON,
Academic Registrar

OFFICIAL APPOINTMENTS

The engagement of persons answering these advertisements must be made through a Local Office of the Ministry of Labour or a Scheduled Employment Agency if the applicant is a man aged 18 *to* 64 *inclusive, or a woman aged* 18 *to* 59 *inclusive unless he or she, or the employment is excepted from the provisions of the Notification of Vacancies Order,* 1952

UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Lecturer in the Department of Mechanical Engineering The duties of the Lecturer will be mainly the teaching of Engineering Design and Drawing and candidates for the post should have a good degree in engineering and some industrial experience Experience in engineering design is desirable but not essential The initial salary will be within the range £650 to £1,350 per annum, according to qualifications and experience

Applications, stating age, qualifications and experience, together with the names of three referees, should be received not later than April 13, 1955, by the undersigned, from whom further particulars of the conditions of appointment may be obtained

STANLEY DUMBELL,
Registrar

UNIVERSITY OF ABERDEEN

Applications are invited for the following posts (1) In Department of Natural Philosophy Lectureship in Experimental Physics, salary scale (c) or (b) Two Lectureships in Electronics, one on salary scale (c) or (b), the second on salary scale (a) Revised salary scales (c) £1,350 to £1,550 per annum , (b) £950 to £1,350 per annum , (a) £650 to £950 per annum Assistantships in Experimental Physics, Theoretical Physics, and Electronics, on revised salary scale £550 to £650 per annum Appointment as Assistant renewable for three to five years, with possibility of appointment as Lecturer if vacancy occurs or if of exceptional merit (2) In Department of Agriculture Lectureship in Agriculture Qualifications required in Agricultural Engineering with special reference to farm equipment and surveying Salary on revised scale (a), £650 per annum rising to £950 per annum All posts carry F S S U and children's allowance , initial placing according to qualifications and experience , part of removal expenses refunded

Applications (eight copies for Lectureships two copies for Assistantships), should be lodged not later than April 15, 1955 with the undersigned from whom forms of application and conditions of appointment should be obtained Applicants outside the British Isles may submit one copy only

W S ANGUS
, Secretary
University of Aberdeen

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Lecturer in Engineering, with special interests in fluid mechanics The appointment will date from October 1, 1955 Initial salary on the scale £650 by £50 to £1,350 per annum, according to qualifications and experience F S S U benefits and family allowances

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea to whom applications must be sent by April 30 1955

FOURAH BAY COLLEGE

SIERRA LEONE
(UNIVERSITY OF DURHAM)

Applications are invited for the post of Pr
pal, vacant on the retirement of Mr F R
M A The College was founded by the Ch
Missionary Society in 1827, affiliated to the
versity of Durham in 1876, and reorganize

I M OVERSEA CIVIL SERVICE

Applications are invited for the following post 'estock Officer, Veterinary Department, Nyasa- id , Duties connected with development of the al animal industry, mainly in African areas ndidates must possess a university degree either dairy husbandry or in agriculture with special- tion in animal husbandry, and some experience stock management Appointment on probation the permanent and pensionable establishment in salary scale £625 to £1,515 a year, plus a non- isionable cost of living allowance of between) to £195 10s a year Outfit allowance of £30 initial salary is £975 a year or less Free pas- ies for officer and wife and up to one full fare children on appointment and leave Govern- nt quarters when available at moderate rental xation at local rates

Apply, giving brief particulars to the Director Recruitment, Colonial Office, Sanctuary Build- s, Great Smith Street, London S W 1, quoting erence BCD 67/4/03

IPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

Lecturer in Chemical Physics of Solids required the Department of Chemical Engineering tober, 1955, or as soon as possible thereafter lary £700 by £50 to £1,000, by £50 to £1,400, 'h F S S U and family allowances Applicants uld have had special experience of *X*-ray 'stallography

Four copies of application, together with names not more than three referees, should be sent the Head of the Department of Chemical En- ieering Imperial College, London, S W 7 (from iom further particulars may be obtained), not er than April 25

UNIVERSITY OF CAMBRIDGE

SCHOOL OF AGRICULTURE

Applications are invited for the post of University Lecturer in Field Experimentation Applicants should possess an honours degree and also appropriate qualifications in agriculture and should have had experience of research and teaching in field experimentation The pensionable stipends of university teaching officers are under review, but the current scale is £750, rising by annual increments of £50 to £1,250 The stipend may be supplemented by a pensionable payment not exceeding £120 on fulfilment of certain conditions A non-pensionable allowance of £50 a year is paid in respect of each dependent child under the age of 16 or in receipt of full-time education

Applications, setting out qualifications and experience, together with the names of not more than three referees, should be sent to the Secretary, School of Agriculture, Downing Street Cambridge, so as to reach him not later than April 13

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for either an Assistant Lectureship or a Lectureship in the Department of Chemistry Candidates should be physical chemists with special interests in infra-red spectroscopy Salary scales Assistant Lecturer £450 by £50 to £550 per annum, Lecturer £550 by £50 to £1,100 per annum Salary scales under review Commencing salary in each case will be at a point on the appropriate scale according to qualifications and experience Membership of F S S U and children's allowance scheme

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, to whom applications must be sent by Wednesday April 6 1955

UNIVERSITY OF GLASGOW

LECTURESHIPS IN EXPERIMENTAL OR THEORETICAL PHYSICS

Applications are invited for Lectureships in Experimental or Theoretical Physics Salary scale Lecturer, £650 by £50 to £1,350, Senior Lecturer, £1,400 by £50 to £1,650 Grade of appointment and initial salary according to experience and qualifications F S S U and family allowance benefits Successful applicants will be expected to prosecute experimental or theoretical research in nuclear physics in addition to teaching duties

Applications (five copies) including the names of two referees, should be lodged not later than April 30, 1955, with the undersigned from whom further particulars may be obtained

ROBT T HUTCHESON,
Secretary of University Court

UNIVERSITY OF MANCHESTER

Applications are invited for the post of Lecturer in Chemistry Preference will be given to candidates with research experience in polymer science Salary on a scale £650 by £50 to £1 350 per annum, initial salary according to qualifications and experience Membership of F S S U and children's allowance scheme

Applications should be sent not later than April 9, 1955, to the Registrar, the University, Manchester, 13, from whom forms of application and further particulars may be obtained

---

IMPERIAL COLLEGE

DEPARTMENT OF ELECTRICAL ENGINEERING

Applications are invited for two Lectureships from October 1, 1955 Candidates should possess a good honours degree in electrical engineering and preferably have completed a graduate apprenticeship or have had similar industrial experience Salary within range £700 by £50 to £1,000 and upwards according to qualifications and experience, with F S S U and family allowances Duties will include undergraduate and postgraduate teaching and the undertaking of research

Applications stating age, academic qualifications and experience, with the names of two referees, should reach the Head of Department, Imperial College, London, S W 7, by April 18, 1955

ANIMAL HEALTH TRUST

Applications are invited for the post of Director of the Trust's Farm Livestock Research Station, which is being developed at Stock, Essex Veterinary qualifications essential good degree in science desirable Salary within the range £1 750 by £100 to £2,250 per annum Federated Superannuation System for Universities

Further particulars from the Scientific Director, The Animal Health Trust, 14 Ashley Place, Westminster, London, S W 1 Latest date for receipt of applications, April 18, 1955

ROYAL MILITARY COLLEGE OF SCIENCE

SHRIVENHAM, BERKSHIRE

The Civil Service Commissioners invite applications from men for the following posts under the War Department (a) One Principal Lecturer or Senior Lecturer (according to age and qualifications), radar and telecommunications or electronic instrumentation (b) One Lecturer, mechanical engineering (c) One Lecturer, electronics (d) A number of posts, normally tenable for three years, as Demonstrators in Physics or Mechanical Engineering or Electronics or Electrical Engineering or Instrumentation All posts are unestablished, but candidates appointed to posts (a) to (c) will be considered for establishment (i e, pensionable) posts as they occur and unestablished service will, subject to the normal rules, count for superannuation purposes under the Superannuation Acts (which also provide gratuity for unestablished service lasting for more than seven years) For posts (d) provision made under F S S U Teaching work is at university level and candidates must have (or obtain in Summer, 1955) an appropriate degree (at least second-class honours) or equivalent Research, for which there are excellent facilities, is encouraged Particular qualifications required as follows For post (a) experience in research, design or teaching in at least one of radar, telecommunications, missile guidance and electronic instrumentation For (b), qualifications in applied thermodynamics For post (c) specialized knowledge of either electronics or telecommunications Age For post (a) at least 31 on January 1, 1955, for Principal Lecturer or 26 on that date for Senior Lecturer For other posts, at least 21 and under 28 on that date, with extension for regular Forces service and for permanent service in the Experimental Officer class Inclusive salaries Post (a) £1,125 to £1 507 (Principal Lecturer) or £970 to £1,125 (Senior Lecturer), posts (b) and (c) £467 10s to £845, posts (d) £487 10s to £615 In assessing starting salaries for posts (b) and (c) credit will be given for approved postgraduate experience and National Service, but will not exceed, for example, £630 at age 25 or £792 10s at age 30 Consideration according to circumstances will be given for posts (a) and (d) Secondment from, and transfer to, Scientific Civil Service may be arranged The College is residential, houses available at economic rents for married men and quarters in residential officers' mess at very reasonable charges for single men Successful candidates to take up duty in October, 1955, or as soon as possible ,

Further particulars and application forms from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W 1, quoting No S4439/55 Application forms must be returned by April 7, 1955

UNIVERSITY OF BIRMINGHAM

DEPARTMENT OF CIVIL ENGINEERING

Applications are invited for a Lecturer (Grade II) in Civil Engineering Salary within the range of £650 to £1,350 (efficiency bar at £900), plus F S S U and family allowance benefits Duties to commence October 1 1955 Applicants should have a good general knowledge of civil engineering subjects, preferably in structural reinforced concrete or hydraulics and have had some practical experience Time and facilities will be available for research work

Three copies of applications, together with the names of three referees, should be forwarded to the Registrar by April 23 Further particulars may be obtained from the undersigned

G L BARNES,
Secretary

The University,
Birmingham, 15

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the post of Lecturer in Metal Physics in the Department of Physics The appointment will date from October 1, 1955 Initial salary on the scale £650 by £50 to £1,350 per annum, according to qualifications and experience F S S U benefits and family allowances

Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, to whom applications must be sent by April 30, 1955

UNIVERSITY OF HULL

Applications are invited for the post of Assistant Lecturer in Mathematics Salary £550 to £650 per annum, with F S S U and children's allowances

Further particulars may be obtained from the Registrar with whom applications (five copies) must be lodged not later than April 25, 1955

MANCHESTER MUNICIPAL COLLEGE OF TECHNOLOGY

(FACULTY OF TECHNOLOGY IN THE UNIVERSITY OF MANCHESTER)

LECTURER OR ASSISTANT LECTURER IN ELECTRICAL ENGINEERING

The Governing Body invites applications for a Lectureship or an Assistant Lectureship in Electrical Engineering in the College of Technology, with the title and status of Lecturer or Assistant Lecturer in the University of Manchester The Department covers a very wide range of aspects of electrical engineering, and all members of staff are expected to undertake, assist in or supervise research Salary Lecturer, £650 per annum, rising by annual increments of £50 to £1,350 per annum Assistant Lecturer, £550 per annum, rising by annual increments of £50 to £650 per annum Commencing salary according to qualifications Superannuation under F S S U and family allowances

Conditions of appointment and form of application may be obtained from the Registrar College of Technology, Manchester, 1 The last day for the receipt of applications is April 30, 1955

B V BOWDEN,
Principal of the College

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Assistant Lecturer in Physics Salary in the scale £600 by £25 to £650 per annum, with F S S U and children's allowances

Application forms, in duplicate, should reach the Registrar, The College, Keele, Staffs, from whom further particulars and application forms may be obtained, not later than May 1, 1955

NATIONAL COAL BOARD

N W DIVISION

Chemist required at the Central Laboratory, Shade House, Pendlebury, Manchester Should possess degree in chemistry or equivalent qualifications Must have sound knowledge of modern instrument techniques, be experienced in investigational and research work and have ability to lead small research group Salary within scale £500 by £25 to £950 per annum

Applications, giving age, education, qualifications and experience to Establishment Officer, 40 Portland Street, Manchester, 1, within fourteen days

UNIVERSITY OF LEEDS

DEPARTMENT OF COAL GAS AND FUEL INDUSTRIES WITH METALLURGY AND CHEMICAL ENGINEERING

The Council invites applications for four posts in the Department in chemical engineering, in gas engineering and in fuel technology Appointments will be made on the Lecturer scale and on the Assistant Lecturer scale (both at present under review)

Applications (three copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than April 30, 1955

UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Lecturer in the Department of Bacteriology A medical qualification is not essential The initial salary will be within the range £650 to £1,200 per annum, according to qualifications and experience

Applications, stating age, qualifications and experience, together with the names of three referees, should be received not later than April 15, 1955, by the undersigned, from whom further particulars of the conditions of appointment may be obtained

STANLEY DUMBELL,
Registrar

UNIVERSITY OF LIVERPOOL

Applications are invited for a Leverhulme Postgraduate Fellowship in any Department of the Faculty of Engineering (which includes the Department of Metallurgy) The Fellowship will be tenable for one year at a value of £500, but may be renewed for a second year at a value of £550

Applications, stating age, experience and qualifications, proposed field of research and the names of two referees, should be received not later than May 1 1955, by the undersigned from whom further particulars may be obtained

STANLEY DUMBELL
Registrar

COMMONWEALTH of AUSTRALIA

APPOINTMENT NO 201/74—VETERINARY BACTERIOLOGIST

The Commonwealth Scientific and Industrial Research Organization invites applications for appointment to a position of Senior Research Officer or Research Officer at its Animal Health Research Laboratory, Parkville, Victoria Duties To undertake research work on aspects of bovine contagious pleuropneumonia If necessary, knowledge of the disease may first be gained by participation of the current work of the Section Qualifications University degree in veterinary science with postgraduate research experience in bacteriology or immunology, or equivalent qualifications Salary Commencing salary will be determined within the range of Senior Research Officer, £A 1 814 to £A 2,078 per annum, £A 42 increments , or Research Officer, £A 1,184 to £A 1,730 per annum, thirteen increments, subject to efficiency review at £A 1,268 and £A 1,520 per annum Fares to Australia (including those of wife and family) will be paid Subject to satisfactory medical examination the appointee may be granted superannuation privileges

Applications, referring to Appointment 201/74, and stating full name, place and date of birth nationality, marital state, present employment, particulars of qualifications and experience, and of war service, if any, accompanied by names and addresses of at least two persons willing to act as referees, if so required, and copies of not more than four testimonials should reach the undersigned not later than April 23, 1955

W IVES
Chief Scientific Liaison Officer

Australian Scientific Liaison Office,
Africa House,
Kingsway, London, W C 2

STOCKPORT COLLEGE FOR FURTHER EDUCATION

Applications are invited for the following posts for full-time Teachers in the College, duties to begin on September 1, 1955 Burnham Technical Salary Scale N J C conditions Lecturer to teach Organic Chemistry Good honours degree and preferably Corporate Membership of the R I C , to assist with advanced work Assistant Lecturer Grade B in Biology Good honours degree in botany and ability to teach advanced work

Application forms and further particulars from the Principal, Stockport College, Wellington Road South, Stockport, to be returned to him by April 1 1955

LONDON COUNTY COUNCIL

Norwood Technical College September, 1955, Grade B, for Department of Chemistry and Biology Should possess honours degree in chemistry, and able to teach physical chemistry to B Sc , general degree level Teaching experience, industrial or research experience desirable Burnham F E salary scale man, £621 by £25 to £1 012 , woman, £566 3s to £1 012 Individual minimum and maximum, according to age, qualifications and experience

Application forms from Principal at College, Knights Hill, West Norwood, S E 27, returnable by April 8 (338)

WALSALL HOSPITAL MANAGEMENT COMMITTEE

BIOCHEMIST (BASIC GRADE)

Applications for the above vacancy from holders of science degree or A R I C diploma, together with names of two referees, should be sent to the Group Secretary, Walsall General Hospital, Staffs

---

BIOCHEMIST (BASIC GRADE) REQUIRED to work in the Biochemistry section of the Pathology Department The work entails routine analysis, and assisting in research projects in the hospital Salary and conditions in accordance with P T A scales, i e , £460 to £765 per annum, according to qualifications and experience —Applications, in writing, giving names of three referees, to the Superintendent, The United Sheffield Hospitals The Children's Hospital, Western Bank, Sheffield, 10

BRITISH ELECTRICITY AUTHORITY, RESearch Laboratories, Leatherhead, require Junior Engineers Candidates should have a university degree, higher national certificate or equivalent qualification in electrical or mechanical engineering or physics Duties include research on electrostatic precipitation or materials testing or instruments for special applications Salary, N J B Grade 5 £475 to £650 per annum —Applications to D Moffat, Director of Establishments, Winsley Street London, W 1, by April 8, 1955, quote Ref NAT /581

RESEARCH FELLOWSHIPS GOVERNMENT SCIENTIFI ESTABLISHMENTS

The Civil Service Commissioners invite a tion for a number of Senior and Junior Re Fellowships tenable for three years at Gove Scientific Establishments, for research int jects of importance to H M Government are no age limits but candidates must no have a first- or second-class honours degree appropriate subject and must be able to shc dence of a very high standard of ability search At least two years' postgraduate ence will be expected of candidates for Fellowships and at least three years of can for Senior Fellowships Exceptionally a date without the academic requirement, bu can produce evidence of outstanding ability search, may be admitted Remuneration according to individual merit and experien rates between £950 and £1,150 for Senior F ships and between £600 and £800 for Fellowships F S S U scheme applies The of research in which Fellowships may be av if candidates of the requisite high quality themselves, cover a very wide range , and F ships may be tenable at any of a consid number of scientific establishments

Further information and application form Civil Service Commission, Scientific Bran Old Burlington Street, London, W 1, q S4440/55 Provisional closing date Octob 1955, but early application advised

---

UNIVERSITY COLLEGE OI KHARTOUM

SUDAN

Applications are invited for (1) Senior Le ship, (2) Lectureship or (3) Assistant Lectu in Veterinary Physiology and Biocher Salary (1) £E 1 600 by £E 75 to £E 1,97 annum (2) £E 1 150 by £E 75 to £E 1,67 annum (3) £E 1,000 by £E 75 to £E 1,15 annum Point of entry determined by qu tions and experience Cost of living allo at present approximately £E 150 per annum fit allowance £50 on first appointment Pa for appointee and family on appointment, ination and leave (each long vacation after Appointment on contract for three to seven (renewable) with bonus on completion month's salary for each year of service)

Detailed applications (eight copies), n three referees to be received by April Secretary Inter-University Council, 1 G Square, London, W C 1, from whom furth formation may be obtained

---

UNIVERSITY COLLEGE OF SWANSEA

Applications are invited for the newly lished Chair of Physical Metallurgy which be financed out of funds provided by M Richard Thomas and Baldwins Limited, an Steel Company of Wales Limited The Pro will be expected to have a special interest scientific aspects of the fabrication of metals appointment will date from October 1, Initial salary £2,000 per annum with supera tion and family allowances

Full particulars may be obtained from Registrar, University College, Singleton Swansea to whom applications must be se April 30, 1955

UNIVERSITY OF LIVERPOO

CHAIR OF VETERINARY PATHOLOG

The Council of the University of Live invites applications for the Chair of Vete Pathology

Further particulars may be obtained from undersigned, by whom twelve copies of ap tions (one by airmail in the case of ove candidates) should be received not later April 30, 1955

STANLEY DUMBELL,
Registr

UNIVERSITY OF ST ANDREV

The University Court invites applications fc Chair of Botany in the University The Prof will be a member of the United College o Salvator and St Leonard, St Andrews salary attached to the Chair is £2,200 per an plus F S S U and family allowances A towards expenses of removal may be made

Applications (30 copies), including the nam three referees, must be submitted by Apri 1955, to the undersigned, from whom further ticulars may be obtained

D M DEVIN
Joint Clerk to the University C

MASSEY AGRICULTURAL COLLEGE

(UNIVERSITY OF NEW ZEALAND)
PALMERSTON NORTH, NEW ZEALAND
LECTURESHIP IN AGRICULTURAL BIOCHEMISTRY

Applications, closing May 6, 1955 are invited for the above position Applicants should possess a degree in biochemistry and/or chemistry, including organic chemistry taken to an advanced stage and should preferably have had experience in the analysis of foods including dairy products Experience in the dairy industry is desirable but not essential Salary £892 8s to £1,042 8s or £1,092 8s to £1,292 8s, according to experience and qualifications

Copies of conditions of appointment are obtainable from the Secretary, The Association of Universities of the British Commonwealth, 5 Gordon Square, London, W C 1, or from the Registrar, Massey Agricultural College, Palmerston North, New Zealand

UNIVERSITY ASSISTANT LECTURESHIPS IN MATHEMATICS

NOTICE

The Appointments Committee of the Faculty of Mathematics give notice that they intend to make appointments to two University Assistant Lectureships For one of these offices consideration will be given to candidates who are qualified in statistics The appointments will be subject to the Statutes and Ordinances of the university and will be for three years in the first instance The maximum tenure of a University Assistant Lectureship is five years The persons appointed will be expected to enter upon their duties on October 1, 1955, or as soon thereafter as is practicable The stipend of a University Assistant Lecturer at present rises from £600 a year to £700 a year by annual increments of £25 The salary scale is under review Family allowances are payable

Candidates should send their applications, with the names of two referees, to the Secretary of the Appointments Committee of the Faculty of Mathematics, the Arts School Bene't Street, Cambridge, so as to reach him by April 30, 1955

ROYAL TECHNICAL COLLEGE

GLASGOW

(In Affiliation with the University)

Applications are invited for Two Lectureships in Mathematics In addition to classes for students of Engineering working for the B Sc degree of Glasgow University and the College Associateship, the Mathematics Department provides classes of honours degree standard leading to the Associateship of the Royal Technical College in Applied Mathematics A postgraduate course in applied mathematics is to be offered in 1955-56 Applicants for the Lectureship should have a research interest in applied mathematics preferably in fluid dynamics Salaries will be on the scale, £650 by £50 to £1,350, with family allowances and superannuation, the starting salaries being dependent on qualification

Forms of application can be had from the Secretary of the College

UNIVERSITY COLLEGE OF KHARTOUM

SUDAN

Applications are invited for appointment to Chair of Anatomy Salary £E 2,500 per annum, cost of living allowance at present approximately £E 150 per annum Outfit allowance £50 on first appointment Passages for appointee and family on appointment, termination and annual leave Appointment on contract for three to seven years (renewable) with bonus on completion (one month's salary for each year of service)

Detailed applications (eight copies), naming three referees, to be received by April 15, by Secretary, Inter-University Council, 1 Gordon Square, London, W C 1, from whom further information may be obtained

UNIVERSITY OF SHEFFIELD

Applications are invited for the Chair of Mechanical Engineering Salary not less than £2 300 a year, with F S S U provision and family allowance

Further particulars should be obtained from the Registrar, the University, Sheffield, 10 to whom applications should be sent by April 30 1955

UNIVERSITY OF SOUTHAMPTON INVITE applications for a Leicester Lovell Research Studentship at £350 per annum, commencing October 1 1955, to study the mechanism and kinetics of reactions of epoxides —Apply to Professor of Chemistry by April 30

UNIVERSITY OF MANCHESTER

Applications are invited for the post of Assistant Lecturer in Chemistry Candidates should have special qualifications in Organic Chemistry Salary on a scale £550 to £650 per annum, with membership of F S S U and children's allowance scheme

Applications should be sent, not later than April 30, 1955, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained

UNIVERSITY OF ABERDEEN

Chemistry Department requires man already trained as Glassblower or prepared to become Glassblower after training University will pay training expenses of suitable candidate Applicants should have done National Service and should have manual skill Wages in range £340 to £480, according to experience and ability

Applications in writing to the Secretary, Marischal College

MINISTRY OF SUPPLY INVITES APPLICATIONS for a limited number of Senior and Junior Fellowships, tenable for three years at the Radar Research Establishment, Malvern, Worcs, commencing in Autumn, 1955 Candidates must be British subjects with normally either a first- or second-class honours degree in an appropriate subject and must be able to show evidence of a very high standard of ability in research Exceptionally a candidate without the academic requirement, but who can produce evidence of outstanding ability in research may be admitted Fellows will be allowed considerable choice of subjects within the fields of interest to the Establishment These include experimental and theoretical research in low temperature physics electrical and optical properties of semi-conductors, infra-red spectroscopy, microwave physics, and electronics For Junior Fellowships candidates should have had at least two years' postgraduate research experience and should preferably be aged 23-26, candidates for Senior Fellowships should have had at least three years' postgraduate research experience and should preferably be aged 26-30 Remuneration will depend on individual merit and will be between £950 to £1,150 per annum for Senior Fellows and £600 to £800 per annum for Junior Fellows Successful candidates will have their appointments brought under F S S U At the expiry of a Fellowship a holder may be considered for an established post at the Establishment if he so desires —Application forms obtainable from the Director, Radar Research Establishment, Malvern, Worcs to whom they must be returned by April 15, 1955, together with suitable testimonials regarding research ability, and, where possible, copies of candidates published papers

MINISTRY OF SUPPLY INVITES APPLICATIONS for a limited number of Senior and Junior Fellowships, tenable for two or three years at the Royal Aircraft Establishment, Farnborough, commencing in Autumn, 1955 Candidates must be British subjects with normally either a first- or second-class honours degree in natural science, engineering or mathematics and must be able to show evidence of a very high standard of ability in research Exceptionally a candidate without the academic requirement, but who can produce evidence ot outstanding ability in research may be admitted At least two years' postgraduate research experience will be expected of candidates for Junior Fellowships, who should preferably be aged 23-26, and at least three years of candidates for Senior Fellowships who should preferably be aged 26-30 Fellows will be required to carry out fundamental research into one of a wide variety of problems associated with the advancement of aeronautics, with particular reference to aerodynamics and aeronautical structures The subjects will be selected according to the training and experience of the Fellows and the needs of the Establishment Remuneration will depend on individual merit and will be between £950 to £1,150 per annum for Senior Fellows and £600 to £800 per annum for Junior Fellows Successful candidates will have their appointments brought under F S S U At the expiry of a Fellowship the holder may be considered for an established post at the Establishment if he so desires —Application forms obtainable from the Director, Royal Aircraft Establishment, Farnborough, Hants, to whom completed forms, together with suitable testimonials regarding research ability and, where possible, copies of candidates' published papers, must be returned by April 15 1955 Overseas candidates should submit written applications stating age, nationality and place of birth of self and parents, educational and academic qualifications, appointments held and research experience

H M OVERSEA CIVIL SERVICE (RESEARCH BRANCH)

WEST AFRICAN COUNCIL FOR MEDICAL RESEARCH

Medical Research Officer required in the Hot Climate Physiological Research Unit, Nigeria, to undertake investigations into Human Physiology, with particular reference to climate, work and nutrition Candidate should be prepared to act for the officer-in-charge on occasion and to travel both in Nigeria and other colonial territories The Unit is situated 10 miles outside Lagos where there are good facilities for a varied social life Candidates should have an honours degree in physiology, possess medical qualifications registrable in the United Kingdom, and have some experience of teaching and/or research Appointment can be made on probation for appointment in the Research Branch of Her Majesty's Oversea Civil Service or on temporary contract with gratuity of 15 per cent of salary payable after satisfactory completion of appointment It is possible that existing superannuation rights could be preserved Selected candidate will be appointed Medical Research Officer, Grade II Salary £800 by £50 to £1,050 a year, plus oversea research allowance of £420 a year Quarters equipped with heavy furniture are available at a rental of 10 per cent of basic salary Outfit allowance on appointment £60 Travelling on duty allowances payable Free passages for officer, wife and children under 13 years of age on appointment and on leave Tours of service vary from twelve to twenty-four months Leave earned at rate of one week for each completed month of duty

Application forms from Director of Recruitment, Colonial Office Sanctuary Buildings, Great Smith Street, London, S W 1 (quoting reference BCD 197/210/06)

BUCKINGHAMSHIRE EDUCATION COMMITTEE

SLOUGH COLLEGE OF FURTHER EDUCATION
WILLIAM STREET, SLOUGH

Principal R Edgar, M Sc, M A

Grade B Assistant for Inorganic Chemistry, required in September Applicants should possess a degree or equivalent qualification

Further particulars and forms of application may be obtained from the Principal, William Street, Slough, to whom they should be returned within fourteen days of the appearance of this advertisement

SOUTH SHIELDS DISTRICT HOSPITAL MANAGEMENT COMMITTEE

Applications are invited from science graduates for the appointment of Biochemist (non-medical) in well-equipped and modern Group Laboratory General Hospital, South Shields Salary either on basic grade or senior grade of Professional and Technical Whitley Council scale, according to qualifications and experience, viz basic grade £410 to £510, and after probationary period £585 to £765, senior grade £835 to £1,080 Post offers facilities for further studies

Applications, accompanied by names of two referees, to Group Secretary, Ingham Infirmary, South Shields, within ten days

UNIVERSITY COLLEGE OF KHARTOUM

SUDAN

Applications are invited for (1) Senior Lectureship or (2) Lectureship in Public Health Salary scales (1) £E 1,750 by £E 75 to £E 1,975 to £E 2 090 to £E 2,170 per annum (2) £E 1,300 by £E 75 to £E 1,825 per annum Point of entry determined by qualifications and experience Cost of living allowance now approximately £E 150 per annum Outfit allowance £50 on first appointment Passages for appointee and family on appointment, termination and leave (each long vacation after first) Appointment on contract for three to seven years (renewable) with bonus on completion (one month's salary for each year of service)

Detailed applications (eight copies), naming three referees to be received by April 15 1955, by Secretary Inter-University Council, 1 Gordon Square London W C 1, from whom further information may be obtained

BOTANIST-BACTERIOLOGIST TO TEACH courses in bacteriology and in public health and some other biological subjects Lecturer or Assistant Professor September, 1955 —Address inquiries to W B Stallworthy, Mount Allison University, Sackville, N B, Canada

COMMONWEALTH of AUSTRALIA

DIVISION OF BUILDING RESEARCH

APPOINTMENT No 390/204 OF RESEARCH OFFICER (RHEOLOGIST)

The Commonwealth Scientific and Industrial Research Organization, Australia invites applications for appointment to a position of Research Officer, at its Division of Building Research Highett, Victoria Duties Investigations into the rheological characteristics of building materials Initial studies will be concerned with bituminous materials Other systems to be studied include clay plaster and lime pastes Qualifications University honours degree in science, with physics and/or chemistry as a major subject or equivalent qualifications Salary Dependent on qualifications and experience, commencing salary will be determined within the range of Research Officer, £A 1,184 to £A 1,730 per annum, thirteen increments subject to efficiency review at £A 1 268 and £A 1,520 per annum Fare to Australia (including those of wife and family will be paid The appointment is subject to a satisfactory medical examination and the appointee may be granted superannuation privileges

Applications, referring to Appointment No 390/204, and stating full name, place date and year of birth, marital state, nationality, present employment, particulars of qualifications and experience, and of war service, if any, accompanied by the names and addresses of two persons willing to act as referees, if required, and copies of not more than four testimonials, should reach the undersigned not later than May 21, 1955

W IVES,
Chief Scientific Liaison Officer
Australian Scientific Liaison Office,
Africa House,
Kingsway, London, W C 2

UNIVERSITY OF BRISTOL

Applications are invited for the post of Junior Fellow in Applied Mathematics for the Session 1955-56, within the salary-range £550 to £650 per annum The appointment may be renewed for a second year Preference will be given to candidates with research experience in fluid mechanics

Further particulars may be obtained from the undersigned, with whom applications must be lodged not later than April 30 1955

H. C BUTTERFIELD,
Registrar and Secretary

THE RESEARCH INSTITUTE (ANIMAL Virus Diseases), Pirbright, Surrey, will require shortly a number of Research Officers to carry out virus research For certain of the posts candidates must have graduated as M R C V S , and for the others should have an honours degree with postgraduate experience in one of the following fields biophysics, biochemistry, bacteriology and virology The posts will be either on the Senior Scientific Officer grade of £970 by five increments to £1,125 per annum, or on the Scientific Officer grade of £477 by twelve increments to £845 per annum (slightly less for female officers) and will be superannuated under the F S S U Commencing salary will be determined in accordance with age, training and postgraduate experience Housing accommodation available for married staff — Applications stating age qualifications and details of present and past appointments, and accompanied by the names of three persons to whom reference may be made, should be addressed to the Secretary immediately

APPOINTMENTS VACANT

WOOL INDUSTRIES RESEARCH ASSOCIATION

Physicists with honours degree or A Inst P required for fundamental research on (i) Adhesion, friction and abrasion of non-metallic substances (ii) Physical adsorption by polymer materials, including infra-red measurements Previous research experience not essential, opportunity for proceeding to a higher degree Commencing salary according to age and experience in range £530 to £845 per annum, with F S S U benefits

Applications to Wool Industries Research Association, Torridon, Headingley, Leeds, 6

PHYSICIST REQUIRED FOR *X*-RAY DIFfraction and other interesting physical investigations, in a Metallurgical Research Laboratory Good prospects and scope exist Pension scheme —Apply, giving full particulars of age, qualifications and experience, to Box 669, T G Scott and Son, Ltd , 143-147 Regent Street London, W 1, quoting reference PX

ATOMIC POWER DEPARTMENT

of

ENGLISH ELECTRIC

requires

MECHANICAL DESIGN ENGINEERS

This is an excellent opportunity for men with any type of medium or heavy mechanical design experience to enter this new field of engineering

Applications should be made to

Dept C P S ,
336-7 Strand, W C 2,
quoting Ref No 1318A

ATOMIC POWER DEPARTMENT

of

ENGLISH ELECTRIC

invites applications from

MATHEMATICIANS

who have or who will have in the near future, postgraduate qualifications in MATHEMATICS

Please write to

Dept C P S ,
336-7 Strand, W C 2
quoting ref no 1367A

REQUIRED FOR PERMANENT RESEARCH positions in U S A Nine Chemists, Physicists, Metallurgists or Chemical Engineers with excellent scientific background Chemists physicists and metallurgists should have or soon expect Ph D degrees Two Mechanical Engineers, well trained in theory and desirous of applying their knowledge practically Applicants should be aged 25 to 30, eligible to emigrate to U S A University training essential Further academic or industrial experience desirable Salaries commensurate with age and experience and according to U S A scales —Apply in writing, stating country of birth and qualifications to E I du Pont de Nemours and Co , Bush House, Aldwych, London, W C 2, England

INDUSTRIAL RESEARCH VACANCIES (male) for Analyst, mainly inorganic and metallurgical , Physical Chemist and Organic Chemist Also for Unqualified Assistants for chemical laboratory and pilot plant work Pension scheme —Write for application form to Sondes Place Research Institute, Dorking, Surrey

LABORATORY ASSISTANT AGED 23 TO 28 required Experienced in chemical analysis of metals , or alternatively a younger man willing to train would be considered Good prospects Salary according to merit —Apply Chief Personnel Officer, Bryce Berger Ltd , Staines, Middlesex Staines 1122

CHEMIST THE CAPE ASBESTOS COMPany require an Inorganic Chemist for their Research Department, which is located at the Barking, Essex, Factory of the Group The work, which will be under the direction of a senior chemist, involves a study of the chemistry of asbestos, inorganic fibres and silicates Candidates must possess a good honours degree The appointment, which is permanent and pensionable, is for a recent graduate and offers the prospect of a career on the technical side of the Company —Apply, Personnel Manager, Barking, Essex

A I M L TECHNICIANS, OR EQUIVALENT standard, required for pharmacological work Male or female —British Schering Research Institute, Alderley Edge, Cheshire

PHYSICAL CHEMIST FOR RESEARCH WORK

Age 25 to 30 years Salary according to appl cant's ability The Colonial Sugar Refinin Company Ltd , Sydney, New South Wale Australia This company is an old-established on (1855) and its activities cover a wide range, in cluding manufacture of raw sugar, refined suga building materials, fermentation products an chemicals These manufacturing activities exten throughout Australia, New Zealand and Fiji Th successful applicant will work in the first instanc in the company's Research Department, Sydney which employs directly some sixty people, includ ing more than twenty graduates The work o the department includes basic investigations int all the activities of the company

Please reply in the first instance to the com pany's Agents Parbury Henty and Co Pty Ltd 20 Eastcheap, London, E C 3

BREWING INDUSTRY RESEARCH FOUNDATION

NUTFIELD, SURREY

Applications are invited from analytical chemist for a senior research post Exceptional faciliti are available for carrying out and supervisin original work largely of a fundamental natur on the application of modern methods to fermen tation and related problems The post is super annuable under F S S U , and the salary will b on a scale commencing at not less than £1,00 per annum, according to qualifications

Applications giving full details of age, quali fications and experience, should reach the Directo not later than April 9, 1955

WOOL INDUSTRIES RESEARCH ASSOCIATION

Physicist with honours degree or A Inst P re quired for weaving research The work involve experimental and analytical investigations o looms and in the laboratory , it requires mechani cal aptitude and a liking for classical physics Previous research experience not essential Com mencing salary according to age and experience i range £530 to £845 per annum, F S S U benefits

Applications to Wool Industries Researc Association Torridon, Headingley, Leeds, 6

THERMODYNAMICISTS WITH DEGREE O equivalent qualification are required for work o wide variety of problems concerned with tempera ture control and air conditioning for high spee flight A number of vacancies also exist fo Technical Assistants in the above field (Ref 125) —Please write in detail, quoting Ref No of position sought to The Personnel Manage (Technical Employment), de Havilland Propeller Ltd , Hatfield, Herts

ANALYTICAL CHEMIST REQUIRED T work in Department dealing with pesticid residues on crops, atmospheric contamination an micro analysis of organic compounds B Sc o A R I C standard necessary Previous practica experience desirable Salary according to ag qualifications and experience —Write (quotin No 1025), giving fullest particulars and sala required to Personnel Manager, Fisons Pes Control Limited, Bourn, Cambridge

CHEMICAL MANUFACTURING ORGAN ization in London area, expanding its Researc Department, invite applications from honour graduate in organic chemistry, with or withou industrial experience Positions are available i both fundamental research and development sec tions Positions are both permanent and pension able, and the salaries will be appropriate to th qualifications and experience of the candidate selected —Apply Box 675, T G Scott and Son Ltd , 143-147 Regent Street, London, W 1

GRADUATE CHEMIST, METALLURGIS or Chemical Engineer required, to deal with prob lems relating to the installation of electroplatin plant and process control Applicants must hav completed military service and be willing to travel —Apply, Electro-Chemical Engineering Co , Ltd 161 Queens Road Weybridge Surrey

LADY CHEMIST, GRADUATE OR H N C required for analysis of electroplating and allie solutions —Apply, Electro-Chemical Engineerin Co Ltd , 161 Queens Road Weybridge Surrey

PHILIPS BALHAM WORKS LTD , 4 Nightingale Lane, S W 12, requires Graduate in Electrical Engineering or Physics preferably wit experience in electronics for development o nucleonic instruments Permanent appointmen with excellent prospects —Applications should b addressed to the Personnel Officer at the above address

ΗE ASSOCIATED ETHYL COMPANY
ited has vacancies for CHEMICAL ENGIN-
.S The work is concerned with the develop-
t, co-ordination and commissioning of modifi-
ons and new engineering projects Experience
hlorine would be an advantage for one of the
s
pplicants should have at least three years'
rience in Chemical Plants and should possess
ifications equivalent to Corporate Membership
ne Institution of Chemical Engineers
ll positions are permanent and progressive
a Company Pension Scheme is available
ries paid will be in accordance with age, ex-
ence and qualifications
pplications, giving full details of the above
ild be made to The Deputy Manager—
onnel, The Associated Ethyl Company
ited, Ellesmere Port, Cheshire

OUNG CHEMIST REQUIRED BY PRO-
sive firm of Canners for their Scottish
neries Experienced quality control in fruit
vegetable canning Excellent opportunity for
le man Reply in strict confidence with full
ils and salary range—Box 678, T G Scott
Son, Ltd, 143-147 Regent St, London, W 1

UALIFIED CHIEF CHEMIST REQUIRED
progressive Company Canning Fruit and Vege-
es Experience in quality control essential
ellent prospect for first-class man, having the
ity to develop new lines State salary required,
erience and qualifications—Fullest details in
ct confidence, to Box 679, T G Scott and
, Ltd, 143-147 Regent Street, London W 1

CIENTIFIC PUBLISHERS IN LONDON
e an editorial vacancy Applicants should
e a science degree, or equivalent, and wide
er than specialized interests Some training
editorial or liaison work would be an advan-
e Pension scheme—Apply, giving full par-
ilars, and salary range expected, to Box 680,
G Scott and Son, Ltd, 143-147 Regent Street
ndon, W 1

YOUNG GRADUATE IN PHYSICS IS
uired to work at Ilford Limited, Watford, on
physical aspects of photographic problems, in
ticular those associated with the photographic
ct of X-rays and γ-rays—Apply in writing to
search Director, Ilford Limited, Ilford, Essex

NELSON RESEARCH LABORATORIES

ENGLISH ELECTRIC CO LTD,

STAFFORD

have a vacancy for a PHYSICIST having an interest in solid state physics and electronics, to work on the fundamental properties and applications of materials suitable for use in electronic storage devices

An honours degree and some research experience are desirable

Salary at present-day levels in accordance with age and qualifications Please reply to Department C P S, 336-7 Strand, W C 2, quoting Ref 1353B

APPARATUS ENGINEERS STANDARD Telephones and Cables Ltd have vacancies for Apparatus Engineers in the fields of electro-acoustics telephone exchange switching apparatus and electronics switching designs and developments The work is varied and involves carrying through designs and developments to the production stage, together with associated laboratory and investigational work An engineering or physics degree is desirable, but higher national certificate standard will be considered Salaries will be paid according to age, qualifications and experience—Write in confidence, giving full particulars to Personnel Manager, Oakleigh Road New Southgate, N 11

COOKE, TROUGHTON & SIMMS LTD, have a vacancy for an Optical Designer at their York factory Preference would be given to a graduate aged 28-35 with the Imperial College Diploma in Technical Optics The salary would be commensurate with qualifications and experience—Apply in writing to the Personnel Officer, Cooke, Troughton and Simms Ltd, Haxby Road, York

MONSANTO CHEMICALS, LIMITED, WILL shortly have two vacancies for Graduates in the Sales Development Group in London (1) A Chemist, Physicist or Engineer, aged 28 to 33 years, having an interest and preferably some experience in technical selling to a variety of industries (2) An Economist, aged 24 to 30 years, with some industrial or commercial experience, preferably in the chemical industry, to establish a forecasting section within the group Both positions are permanent and pensionable, and may involve travel Substantial salaries will be offered and there are excellent opportunities—Apply in writing in the first instance, giving full details of age, education, training and experience, to the Chief Personnel Officer, Monsanto Chemicals, Limited, 8 Waterloo Place, London S W 1

PHYSICIST OR PHYSICAL CHEMIST REquired for the new Mullard Magnetic Materials Factory at Crossens, Southport Applicants should be interested in the solid state Work involves research and development in the field of magnetic ceramics, and offers good prospects Successful applicant will be required to work at Blackburn initially during which period lodging allowances and expenses will be paid—Apply to the Works Personnel Officer, Mullard Blackburn Works Ltd, Philips Road, Blackburn, Lancs, giving fullest details and quoting ref SO/ML/2

ANALYTICAL CHEMIST REQUIRED BY A company manufacturing cosmetic preparations The successful applicant would be required to undertake interesting work dealing with oils, fats waxes and detergents The main requirement is a practical knowledge of analytical techniques and a degree or A R I C would be an additional advantage The starting salary will be in accordance with qualifications and experience and there are good prospects for the right applicant The company operates a pension scheme—Applications, which will be treated in confidence, should be addressed to the Personnel Manager County Laboratories Ltd, Honeypot Lane, Stanmore, Middlesex

GLASSBLOWER WITH EXPERIENCE REquired by Cambridge Laboratory Furnishers Good pay for suitable candidate—Box 670, T G Scott and Son Ltd, 143-147 Regent Street, London, W 1

HIGH VACUUM STOPCOCKS

ELECTRICAL ENGINEER IS REquired by a well-known chemical concern in the North-west of England, to take charge of the electrical department at one of their large factories The department is responsible for all transforming equipment and medium voltage distribution system is installed in the factory Candidates should be between 35 to 40 years of age and have graduate or equivalent qualifications in electrical engineering At least eight to ten years' industrial experience is essential, together with experience of management Salary will be commensurate with qualifications —Box 672, T G Scott and Son, Ltd , 143-147 Regent Street, London, W 1

GRADUATES IN MATHEMATICS (FEMALE) required for the detailed analysis and tabulation of experimental data Previous experience not necessary —Applicants should write, giving full details to Personnel Department (E D /129), E M I Eng Dev Ltd , Hayes, Middlesex

---

A PHYSICIST IS REQUIRED TO FILL AN important post as Leader of a large Research Group on Solid State Physics He would be engaged solely on research and would work directly with the Chief Scientist, he would not be concerned with development The type of man envisaged is one having a well established reputation in the field of solid state physics and the salary offered would be commensurate with this —Application should be made to the Director, Research Laboratories of the General Electric Company Ltd , Wembley, Middlesex (Ref RLH/21)

PLANT MANAGER REQUIRED FOR EXtraction Plant in East Africa Applicants should have chemical engineering knowledge and be capable of controlling European and native labour Responsible for plant installations and general maintenance Must be conscientious and undertake control of plant process Salary from £1 500 upwards according to experience Home leave, pension and bonus schemes —Write Box "MR/49," c/o 95 Bishopsgate, E C 2

AERODYNAMICISTS WITH A GOOD DEgree and several years' experience in aircraft or missile industry, required to work on a wide variety of dynamics problems associated with major guided weapon development Aerodynamicists with a degree or equivalent qualification, preferably with several years' experience in aircraft or missile industry required to work on analysis and development of flight trials of above weapon Competitive salaries paid for right men —Please write in detail, quoting Ref 119, to The Personnel Manager (Technical Employment), de Havilland Propellers Ltd , Hatfield, Herts

---

APPLICATIONS ARE INVITED FROM Physicists with degrees or their equivalent, for research into machining problems associated with the manufacture of large steam and gas turbines —Apply, quoting reference TJ and stating age, qualifications and experience, to the Director of Research, The British Thomson-Houston Co Ltd , Rugby

---

ELECTRONIC ENGINEERS WITH DEgrees in physics or engineering required for important and interesting work on the research and development of special equipment Good opportunity and high salary rate —Write to Managing Director, Microcell Ltd , 56 Kingsway, London, W C 2

Advertisers please note You must add "Apply Employment Exchange" unless the employment advertised or the workers required are excepted under the Notification of Vacancies Order

---

THE RESEARCH LABORATORIES OF A large chemical manufacturing organization invite applications for progressive posts on their scientific staff The laboratories are well equipped to undertake research by the latest techniques Applicants should preferably have an honours degree or equivalent and be interested in investigational work This work is related to a wide field of manufacturing operations and to product development primarily in connection with titanium and its compounds and particularly the oxide Opportunities exist for those wishing to specialize in analytical, inorganic or physical chemistry, applied chemistry, metallurgy, physics or process development Some of the vacancies will be of interest to students or qualified National Servicemen in their final year The company operates a pension scheme and prospects and conditions of employment are very good The commencing salary will be £500 to £950 per annum, depending on experience and qualifications All applications will be treated in strict confidence —Those interested may obtain application forms and further information from The Research Controller, The Research Laboratories Laporte Titanium Limited, Kingsway, Luton, Beds

---

RESEARCH AND DEVELOPMENT ENGINeers are required for work on Electronic Switching, Computing and Control Apparatus Applicants should preferably have had experience of one or more of the above A good university degree in engineering or physics would be an advantage Further vacancies exist for Junior Engineers and Technical Assistants Excellent opportunities for advancement to more senior positions Starting salary, according to qualifications and experience, will be in the range of £400 to £1,100 per annum The Company operates a superannuation scheme and offers attractive working conditions with generous holiday and leave arrangements, and good social and recreational facilities —All applications will be dealt with in confidence and should be addressed to the Director of Research, British Telecommunications Research Ltd , Taplow Court, Taplow, Bucks

GRANTS & SCHOLARSHIPS

IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

ENGLISH ELECTRIC COMPANY'S BURSARIES IN HYDRO-POWER ENGINEERING

Notice is hereby given that a number of English Electric Company Bursars in Hydro-power Engineering will be elected in June, 1955 The Bursaries are of the value of £250 for one year, tenable for postgraduate study in the Civil Engineering Department of the Imperial College Bursars pay the appropriate College tuition fee The Bursaries will be recommended for supplementation by the Ministry of Education Bursars who successfully complete the course will be eligible for the award of the Diploma of the Imperial College (D I C)

Candidates should have an honours degree in Engineering or an equivalent qualification, and applications should be received before June 1, 1955, by the Deputy Registrar, City and Guilds College, Exhibition Road, London, S W 7, from whom further details may be obtained

UNIVERSITY OF SOUTHAMPTON

ESSO RESEARCH STUDENTSHIP

Applications are invited from men who hold or expect to hold a good university degree, with chemistry as principal subject, for a research studentship in chemistry, endowed by the Esso Petroleum Co Ltd , at £350 per annum, to commence October 1, 1955

Candidates should apply to the Professor of Chemistry from whom further particulars can be obtained, before May 14

GAS COUNCIL

RESEARCH SCHOLARSHIPS

The Gas Council invites applications for fi Research Scholarships from graduates or pr pective graduates in physics, chemistry or eng eering at British universities The scholarsh will be awarded for a period of three years fro September 1, 1955, and the universities in whi they will be tenable are as follows Univers of Oxford, Departments of Chemistry , Univers of Cambridge, Department of Chemical Engi eering , University of London, Departme of Chemical Engineering at either t Imperial College of Science and Tec nology or University College , Universi of Birmingham, Department of Chemical Engi eering , University of Glasgow, Department Chemistry The subject proposed for resear must afford scope for original work and be a character approved by the Research Committ of the Gas Council, which is interested in pro lems related to the manufacture distribution use of gas Each scholarship will carry allowance at the rate of £350 a year, togeth with the payment of university and college fee

Particulars and application forms may be o tained from the Secretary, The Gas Council, Grosvenor Place, London, S W 1, or from t Head of any one of the University Departmen named above Applications should be submitt on or before April 15, 1955 to the Secretary T Gas Council, or, if the candidate is a student one of the University Departments named abov to the Head of that Department

UNIVERSITY OF SHEFFIELD

ELLISON RESEARCH FELLOWSHIPS of least £260 p a with remission of fees for researc in chemistry or physics Tenable for three yea from October 1, 1955 Open to graduates British universities Full particulars can be ol tained from the undersigned, to whom applic tions should be sent not later than June 12, 195

A RESEARCH SCHOLARSHIP of £350 p a f research work connected with the chemistry amino-acids, peptides and proteins Tenabl from October, 1955, and renewable, subject t satisfactory progress, up to a period of three year

Applications, giving full particulars of qualific tions and the names of two referees, must b made to the undersigned not later than June 1955

STABILISED POWER SUPPLY UNIT FOR PHOTO-MULTIPLIERS

Ediswan now have available a new stabilised power supply unit which has been specially designed to feed Photo-Multipliers. It is particularly suitable as a supply unit for Ediswan Mazda Photo-Multipliers type 27 M1, 27 M2 and 27 M3.

BRIEF SPECIFICATION — Type R 1184

INPUT	OUTPUT	STABILITY	OUTPUT RESISTANCE	RIPPLE
200-250 v, 40-100 c p s	High stability low ripple D C supply variable between 300 and 1,100 volts Max current 2 mA Pos or neg may be earthed	A 10% change in mains input voltage results in a change of less than 0 1% between 1,100 volts and 600 volts output	Approximately 1,500 ohms	Less than 0 01% R M S

MOUNTING The Unit is suitable for standard rack mounting or for bench use Bench Stands are available

PRICE — £48

Further information is available on request

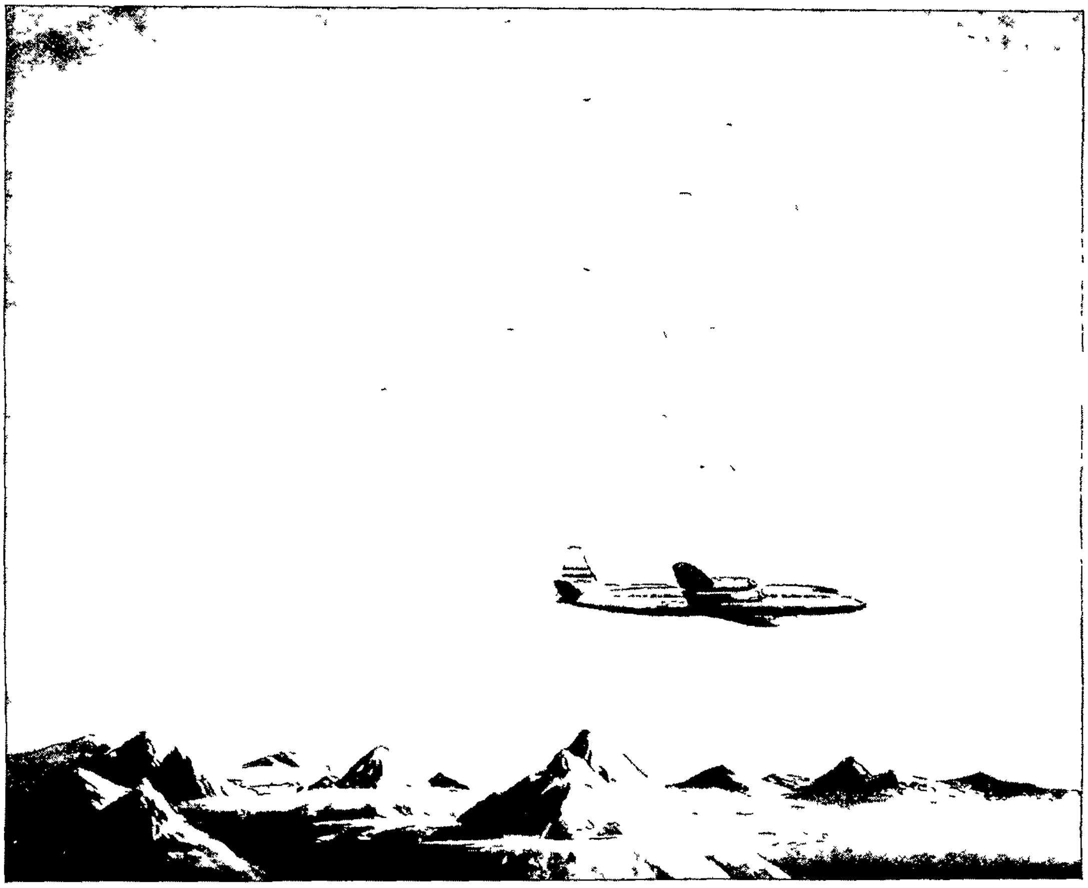
SP115



"The Tiger that lurks in the skies"
. . . will FLUOROCARBONS be the answer?

"Fire", the tiger of the skyways has not yet been banished from aircraft—and scientists the world over are still seeking a complete solution to this menace Fluorocarbons may well provide the answer and would seem to offer the highest possibilities of evolving completely fire-proof aircraft
Investigations have shown that Fluorocarbon liquids can replace the inflammable fluids at present used in hydraulic control systems and de-icing equipment Lubricants too can be made of Fluorocarbons—in addition, the application of Fluorocarbons to high speed bearings and inflammable paints is well within the bounds of possibility

ANHYDROUS HYDROFLUORIC ACID HYDROFLUORIC ACID
BORON TRIFLUORIDE · BENZOTRIFLUORIDE · FLUOSULPHONIC ACID

The above compounds are of great value in the manufacture of fluorinated materials and are available in commercial quantities Industrial applications include catalysts, lubricants, plastics and specialised welding
Should you have any problems or theories on these or any other applications please consult us
